### **USERS INSTRUCTIONS**

#### INTRODUCTION

#### **Dear Customer**

Your Vokèra Easi-Heat Plus Ci boiler has been designed to meet and exceed the very latest standards in gas central heating technology, and if cared for, will give years of reliable use and efficiency.

Please therefore take some time to read these instructions carefully.

#### Do's and Don't's

- Do ensure that the system pressure is periodically checked
- Do ensure that the boiler should not be used by children or unassisted disabled people
- Do ensure that you know how to isolate the appliance in an emergency
- **Do** ensure that you are familiar with the appliance controls
- Do ensure that your installer has completed the appliance log book section
- Do not attempt to remove the appliance casing or gain internal access
- Do not hang clothes etc. over the appliance
- Do not forget to have the appliance serviced annually.

This booklet is an integral part of the appliance. It is therefore necessary to ensure that the booklet is handed to the person responsible for the property in which the appliance is located/installed. A replacement copy can be obtained from Vokèra customer services.

At the end of its life, the product should be not be disposed of as solid urban waste, but rather it should be handed over to a differentiated waste collection centre.

#### 1. THINGS YOU SHOULD KNOW

#### 1.1 GAS APPLIANCES

#### Gas Safety (Installations and Use) Regulations (UK).

In the interests of your safety and that of others it is a legal requirement that all gas appliances are installed and correctly maintained by a competent person and in accordance with the latest regulations.

#### 1.2 ELECTRICAL SUPPLY

Please ensure that this appliance has been properly connected to the electrical supply by means of a double pole isolator or un-switched socket, and that the correct size of fuse (3 AMP) has been fitted.

Warning: this appliance must be earthed!

#### 1.3 GUARANTEE REGISTRATION CARD

Please take the time to fill out your guarantee registration card. The completed warranty card should be posted within 30 days of installation.

### 1.4 APPLIANCE COMMISSIONING CHECKLIST (UK only)

A checklist section can be found at the rear of the appliance installation booklet. This important document must be completed during the installation/commissioning of your boiler. All GAS SAFE registered installers carry a GAS SAFE ID card, and have a registration number. These details should be recorded in the Benchmark commissioning checklist section within the installation booklet. You can check your installers details by calling GAS SAFE direct on 08004085500. Failure to install and commission the appliance in accordance with the manufacturers instructions will invalidate the warranty. This does not affect your statutory rights.

#### 1.5 HOW DOES IT WORK?

Your Easi-Heat Plus Ci boiler supplies heated water to your radiators and hot water to your hot water taps.

The central heating is controlled via a time clock and any thermostats that your installer may have fitted. The boiler will light when it receives a request from the time clock via any thermostat that may be installed, or whenever a hot water outlet (tap) is opened.

Your Easi-Heat Plus Ci boiler lights electronically and does not have a pilot light.

In the unlikely event of a fault developing with your boiler, the supply of gas to the burner will be terminated automatically.

#### 1.6 DIMENSIONS

Easi-Heat Plus 25-29-32 Ci	
HEIGHT	715 mm
WIDTH	405 mm
DEPTH	250 mm

#### 1.7 CLEARANCES REQUIRED

ABOVE	150 mm
BELOW	150 mm
LEFT SIDE	12 mm
RIGHT SIDE	12 mm
FRONT	600 mm

#### 1.8 FROST PROTECTION SYSTEM

The Easi-Heat Plus Ci is equipped with a built-in frost protection system, this enables the boiler to over-ride the time controls – even if switched off – and operate the burner and/or pump, should the temperature drop below 5 °C for the main and for the DHW line. In particular the burner will be in ON status until the main temperature reaches 35 °C for CH appliance and 55 °C for DHW appliance.

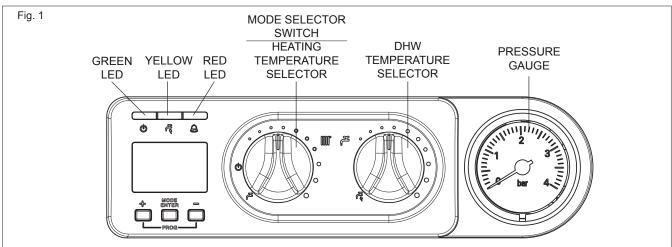

Please note that the frost protection system is designed to protect the appliance only, should frost protection be required for the heating system, additional controls may be required.

#### NOTE

The frost protection system is reliant on the appliance having a permanent electrical supply, and being in a non-fault condition.

#### 1.9 APPLIANCE STATUS INDICATORS

Your boiler is equipped with 3 status LED indicators, the Green LED indicates that the flame is present, the Red LED indicates the appliance has detected a fault, whilst the Yellow LED indicates that DHW pre-heat function is working or Servicing operation is in progress.

#### **BOILER STATUS LED**

**Green LED** Boiler is working/responding to a heating/hot water request

Red LED Boiler has identified a fault and has failed-safe. Refer to instructions on how to reset

Yellow LED DHW pre-heat function working/Service operation

#### **DHW TEMPERATURE SELECTOR**

Move the selector clockwise to increase the hot water outlet temperature, or counter-clockwise to reduce the temperature

#### PRESSURE GAUGE

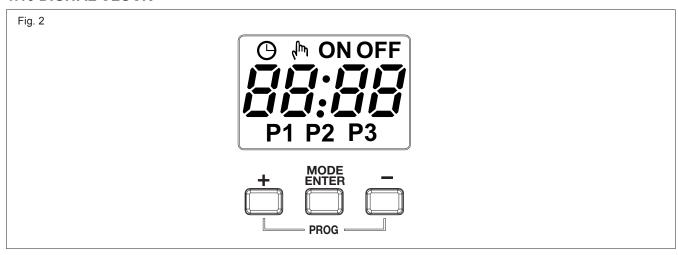

Ensure the system pressure is set correctly (minimum 0.5-bar)

#### MODE SELECTOR SWITCH/HEATING TEMPERATURE SELECTOR

Mode selector switch:

<b>=</b>	Hot water only - Select this position if you want the boiler to supply hot water only (no heating).  Hot water temperature selector: move the selector clockwise to increase the heating outlet temperature, or counter-clockwise to reduce the temperature (range: 37 °C - 60 °C). The display shows, after more than 3 seconds, the delivery temperature.	0	
7	DHW pre-heat function - Turning the domestic hot water temperature adjustment knob to the symbol activates the pre-heating function. Bring the domestic hot water temperature adjustment knob back to the required position. The activation of this function is indicated with the yellow led on. This function keeps the water in the domestic hot water exchanger hot, to reduce standby times when a request is made. To deactivate the pre-heat function, rotate the domestic hot water temperature adjustment knob back to the symbol. Bring the domestic hot water temperature adjustment knob back to the required position. This function cannot be activated when the boiler is OFF: function selector to OFF position.  During the pre-heat function the display shows the time.	0	
IIII.	Heating & hot water - Select this position when you want the boiler to respond to a heating and hot water request from the time-clock programmer. Heating temperature selector: move the selector clockwise to increase the heating outlet temperature, or counter-clockwise to reduce the temperature (range: 40 °C - 80 °C for standard central heating). The display shows, after more than 3 seconds, the delivery temperature.  The automatic temperature control function (SARA) is factory disabled. To enable this function please contact the Vokèra Customer Service.	0	
Ф	<b>Boiler at OFF/standby</b> - Select this position when you want the boiler to be switched off for short periods (days) or if the boiler requires to be reset. The display is completely shutdown.	0	
	<b>Pressure gauge</b> shows the current pressure of your heating system, the gauge should be set between 1 and 1.5 BAR. When the appliance is operating the gauge may rise or fall slightly, this is quite normal. The minimum permissible level for the safe and efficient operation of the appliance is 0.5 BAR. Should the pressure fall below 0.5 BAR, the boiler may lockout.	correct pressure value	2 ber 4.

#### 1.10 DIGITAL CLOCK

Button	Main Function	Secondary Function
+	Used to adjust time - increa- se minutes and hours values	Use to visualize P1-P2-P3 heating pattern (press 5sec)
_	Used to adjust time - decrea- se minutes and hours values	Use to reset the programmed heating pattern (see section 1.15)
MODE ENTER	Use to change mode of opera- tion and to con- firm a choice	
+ -	Use to enter the heating pattern ON/OFF times	

The Easi-Heat Ci incorporate a built-in digital clock and multi-informative LCD display.

The digital clock is pre-programmed with a default heating pattern (see table 1 below); however this can be modified to suit individual needs.

Table 1

	Pre-programmed Heating Pattern				
	am pm				
	ON OFF ON OFF			OFF	
P1	06:30	08:30	-	-	
P2	-			22.30	
P3	dis. dis. dis. dis.				

0	Description/Franchism			
Symbol/Icon	Description/Function			
:88	Displays current minutes past the hour			
<i>88:</i>	Displays current hour			
P1 P2 P3	Heating patterns			
4pm	Displays over-ride function (manual mode) that is currently active:			
Ф	Heating pattern is following the programmed ON/OFF times (auto):  On: space heating enable following P1 - P2 - P3 pattern  OFF: space heating desabled - following P1 - P2 - P3 pattern			
-	Boiler in stand-by			
A01	Fault code example - see specify chapter			

#### 1.11 MODES OF OPERATION

The built-in digital clock has the following modes of operation:

- ON / OFF where the clock uses the programmed heating pattern (default or user defined) to switch the heating ON & OFF at pre-selected times (see table 1).
- 2.  $\sqrt[h]{}$  ON where the clock is set to provide heating constantly ON (in this mode the default or user defined heating pattern is ignored).
- 3. (Im) OFF where clock is set to have the heating constantly OFF (in this mode the default or user defined heating pattern is ignored).

#### 1.12 SETTING THE TIME

During power on, the system displays for two seconds the device software revision index and then all the symbols of the display and the backlight for a second.

Ensure that the boiler is electrically supplied.

With the boiler on "OFF/RESET" or "SUMMER" mode the clock has no control on the boiler functionality.

The clock format is the 24h format.

If the clock has to be set for the first time, the display shows 00:00 flashing. In this situation the clock remains stationary at 00:00 and is not increased.

- Press the MODE ENTER button for at least three seconds to enter the clock settings.
- Press the button to increase the minutes value or press the button to decrease the value.
- Once the correct minutes value is displayed, press the clock button to store this setting and move to the hours value.
- Press the button to increase the hours value or press the button to decrease the value.
- Once the correct hours value is displayed, press the clock button to store this setting.

NOTICE: If the clock is already programmed (HH:MM) press for clock visualization, should the time require to be corrected, press again the button for at least three seconds. The clock value on the display flashes (slow flashing). Proceed to set the time as described above.

#### 1.13 CHANGING THE HEATING PATTERN

The built-in clock is pre-programmed with a default heating pattern (table 1), however this can be changed to a user defined heating pattern.

To insert a new heating pattern or change an existing one, proceed as follows:

from main display view, press and hold simultaneously the program buttons the display shows PROG for a short time.

- P1 and ON are displayed, and the clock segments will flash. Press the button to set the P1 'ON' time. The value will move in incremental steps of 15-minutes.
- Press the clock button to store the setting. The display will show as the example below (P1 'ON' time is set at 08:00):

- P1 and OFF are displayed, and the clock segments will flash. Press the the button to set the P1 'OFF' time. The value will move in incremental steps of 15-minutes. Keeping press the important button, the values increase quickly.
- Press the clock button to store the settings. Will show as the example below (P1 'OFF' time is set at 12:00):

Proceed as above to programme P2 ON- P2 OFF and/or P3 ON - P3 OFF if required.

Note: the heating time pattern proramming must be completed.

#### Example

On completion press to save and exit programming (normal display is resumed).

 If during the time pattern programming no key is pressed. for more than 20 seconds, the display exits the programming function and returns to normal (data are not stored).

The band P1 is mandatory and cannot be disabled, as a consequence, it is necessary for P1 'ON' & P1 'OFF' times to be inserted (see above); however P2 and/or P3 can be disabled, by setting ON and OFF times at the same values (ON2 = OFF2 - ON3 = OFF3).

To easily view the programmed data of time patterns, press for 5 seconds the key.

The display shows sequentially P1 - P2 - P3 programmed data. If P2 or P3 are disables the display shows "dIS".

PROGRAM	START TIME	END TIME
P1	P1 ON	P1 OFF
P2	P2 ON or diS	P2 OFF or diS
P3	P3 ON or diS	P3 OFF or diS

#### 1.14 MODE OF OPERATION

To change the mode of operation, e.g. Auto () to Manual (), press the button; the display will show the following:

- OFF: Heating is in an OFF period according to the programmed heating pattern
- $\Theta$  ON: Heating is in an ON period according to the programmed heating pattern
- 1 OFF: Heating is being controlled manually and is switched constantly OFF
- <sup>Im</sup> ON: Heating is being controlled manually and is switched
   constantly ON.

#### 1.15 RESET PROGRAMMED HEATING PATTERN

The programmed heating pattern can be reset as described

- press the \_\_\_ button for 5 seconds, the display shows dEF
- quickly press the button to confirm. dEF blinks on the

This procedure cancels the programmed pattern and the clock returns to the default program (see table 1).

#### 1.16 DATA RETENTION

The appliance internal memory stores data even if/when the appliance has been isolated from the electrical supply.

In this case, the clock memory, i.e. actual time and programmed ON/OFF times, will be retained for a maximum of 3-hours. If the appliance remains isolated for longer than 3-hours, it will be necessary to re-programme the clock.

The appliance must be connected to the power supply for at least 24-hours for the internal battery to become fully charged.

#### 2. GETTING STARTED

#### 2.1 BEFORE SWITCHING ON

Before switching the appliance on, please familiarise yourself with:

- how to isolate the appliance from the gas, water, and electricity supplies;
- how to check and top-up if necessary the system water pressure;
- the time clock (if utilised);
- any external thermostats and their functions;
- the appliance controls.

#### 2.2 APPLIANCE CONTROLS (see fig. 1)

The appliance controls are situated on the lower front of the appliance. The appliance controls include:

- pressure gauge;
- appliance mode selector;
- temperature selector;
- burner ON mode (green);
- fault indicator (red);
- DHW pre-heat function working/servicing mode indicator (vellow)
- integral time clock.

#### NOTE

The appliance frost protection is active in all the boiler modes. The **temperature selectors** can be used to vary the temperature of the water that circulates around your radiators and the water that flows from your hot water taps. The temperature range is adjustable between 40 °C and 80 °C for the central heating, and between 37 °C and 60 °C for the hot water.

The **3 LED normally** shows the operating temperature of the appliance.

When the **status indicator (Green) is lit** it indicates that the flame is present and the burner is ON.

When the **fault indicator (Red)** is **lit** it indicates that the appliance has identified a possible fault and performed a safety lockout. When the yellow LED is lit it indicates that DHW pre-heat function is working and that there is a Servicing operation in progress. The **integral time clock** can be used to switch the heating on and off at pre-determined intervals (see 1.10).

#### 2.3 LIGHTING THE BOILER

Ensure the gas and electrical supply to the boiler are turned on.

Turn the mode selector switch to the **ON** position. When there is a request for heating or hot water via the time clock or programmer, the boiler will begin an ignition sequence. When the appliance reaches the CH set temperature, the burner will go off for a minimum period of approximately 3 minutes.

When the programmer/time clock or external thermostats heating request has been satisfied, the appliance will switch off automatically.

#### 2.4 ADJUSTING THE HEATING TEMPERATURE

Rotate the temperature selector – clockwise to increase, counter-clockwise to decrease – to the desired temperature setting. The temperature can be set from a minimum of 40 °C to a maximum of 80 °C (if standard CH mode is selected).

#### 2.5 ADJUSTING THE HOT WATER TEMPERA-TURE

Rotate the temperature selector – clockwise to increase, counter-clockwise to decrease – to the desired temperature setting. The temperature can be set from a minimum of 37 °C to a maximum of 60 °C. If the temperature at the outlet is still not sufficiently hot enough, it may be necessary to reduce the flow of water at the hot water outlet (tap).

#### NOTE

If the appliance fails to ignite during the ignition sequence, it will enter a lockout condition. Should this occur, please allow a period of at least two minutes before re-setting the appliance.

#### 2.6 EXPLANATION OF FEATURES

Although the Vokèra Easi-Heat Plus Ci has been designed for simplicity of use, it utilises the latest in boiler technology, enabling a host of functions to be carried out simultaneously.

#### 2.7 AUTOMATIC TEMPERATURE CONTROL

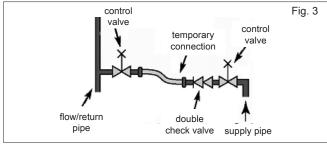

The automatic temperature control function (SARA), permits the boiler (when the heating temperature selector is set within 5 and 7 sector) to automatically adjust (raise) the heating. The activation and the disable of the function is visualized by blinking the green led.

#### 3. HOW TO...

### 3.1 HOW TO TOP-UP THE SYSTEM PRESSURE (fig. 1 - 3)

The system pressure must be checked periodically to ensure the correct operation of the boiler. The needle on the gauge should be reading between 1 and 1.5 bar when the boiler is in an off position and has cooled to room temperature. If the pressure requires 'topping-up' use the following instructions as a guide.

- Locate the filling valve connections (usually beneath the boiler, see fig. 3).
- Attach the filling loop to both connections.
- Open the filling valve slowly until you hear water entering the system.
- Close the filling valve when the pressure gauge (on the boiler) reads between 1 and 1.5 bar (see fig. 1).
- Remove the filling loop from the connections.

#### 3.2 HOW TO RESET THE APPLIANCE

When the red fault LED is illuminated, the appliance will require to be reset manually. Before resetting the boiler, check what action is required to be taken, using the information on the fault code table below. Allow a period of two minutes to elapse before rotating the mode switch to the **b** position (see fig. 1).

#### **IMPORTANT**

If the appliance requires to be reset frequently, it may be indicative of a fault, please contact your installer or Vokèra Customer Services for further advice.

### 3.3 HOW TO SHUT DOWN THE SYSTEM FOR SHORT PERIODS

The system and boiler can be shut down for short periods by simply turning the mode selector switch to the off position. It is also advisable to turn off the main water supply to the house.

### 3.4 HOW TO SHUT DOWN THE SYSTEM FOR LONG PERIODS

If the house is to be left unoccupied for any length of time – especially during the winter – the system should be thoroughly drained of all water. The gas, water, and electricity supply to the house should also be turned off. For more detailed advice contact your installer.

#### 3.5 HOW TO CARE FOR THE APPLIANCE

To clean the outer casing use only a clean damp cloth. Do not use any scourers or abrasive cleaners.

#### 3.6 FAULT CODES AND VISUALISATIONS

CAUSE	ALARM CODE	Led RED	Led YELLOW	Led GREEN	ALARM TYPE
OFF				blinking 0.5 ON/ 3.5 OFF	None
Boiler stand-by	-			blinking 0.5 ON/ 3.5 OFF	Signal
ACF fault lockout module ACF electronics fault fault Fumes exhaust - air intake obstruction fault	A01	ON			Definitive lockout
Limit thermostat fault	A02	blinking 0.5 ON/ 0.5 OFF			Definitive lockout

Calibration service	ADJ	blinking 0.5 ON/	blinking 0.5 ON/0.5 OFF	blinking 0.5 ON/	Signal
Calibration installer		0.5 OFF	-	0.5 OFF	
Chimney sweep	ACO		blinking 0.5 ON/0.5 OFF		Signal
Purge cycle mode active		blinking 0.5 ON/ 1.0 OFF	blinking 0.5 ON/1.0 OFF	blinking 0.5 on/ 1.0 OFF	Signal
Preheating function active			ON		Signal
Preheating function running	time				Signal
Domestic water heat request	60°C				Signal
Heating heat request	80°C				Signal
Flame ON				ON	Signal

#### 4. WHAT IF...

#### 4.1 WHAT IF I SUSPECT A GAS LEAK

If you suspect a gas leak, turn off the gas supply at the gas meter and contact your installer or local gas supplier. If you require further advice please contact your nearest Vokèra office.

### 4.2 WHAT IF I HAVE FREQUENTLY TO TOP-UP THE SYSTEM

If the system regularly requires topping-up, it may be indicative of a leak. Please contact your installer and ask him to inspect the system.

### 4.3 WHAT IF THE APPLIANCE IS DUE ITS ANNUAL SERVICE

Advice for tenants only

Your landlord should arrange for servicing.

#### Advice for homeowners

Please contact Vokèra Customer Service (0844 3910999 (UK) or 056 7755057 (ROI) if you would prefer a Vokèra service engineer or agent to service your appliance. Alternatively your local GAS SAFE registered engineer may be able to service the appliance for you.

#### 4.4 WHAT IF I NEED TO CALL AN ENGINEER

If you think your boiler may have developed a fault, please contact your installer or Vokèra Customer Services (0844 3910999 (UK) or 056 7755057 (ROI) have all your details to hand including full address and postcode, relevant contact numbers, and your completed appliance log book.

### INSTALLATION AND SERVICING INSTRUCTIONS

#### INTRODUCTION

All installers are asked to follow the Benchmark Scheme by adhering to the Code of Practise, which can be obtained from www.centralheating.co.uk.

The Easi-Heat Plus Ci comprises a range of high-efficiency combination boilers with outputs to DHW of 25kW, 29kW and 32kW respectively.

These appliances – by design – incorporate electronic ignition, circulating pump, expansion vessel, safety valve, pressure gauge and automatic by-pass.

The Easi-Heat Plus Ci range is produced as room sealed, category II2H3P appliances, suitable for internal wall mounting applications only.

Each appliance is provided with a fan powered flue outlet with an annular co-axial combustion air intake that can be rotated – horizontally – through 360 degrees for various horizontal or vertical applications. The Easi-Heat Plus Ci can also be used with the Vokèra twin flue system.

The Easi-Heat Plus Ci is approved for use with C13 & C33 type flue applications.

These appliances are designed for use with a sealed system only; consequently they are not intended for use on open vented systems.

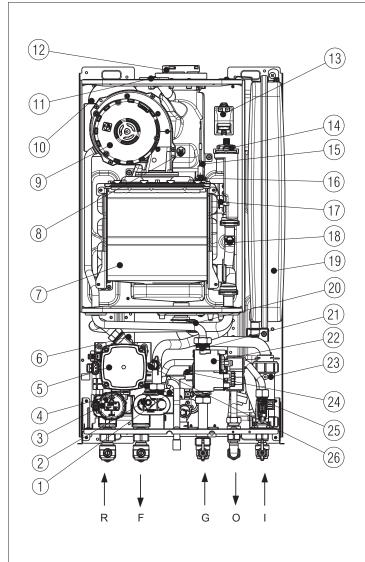

This booklet is an integral part of the appliance. It is therefore necessary to ensure that the booklet is handed to the person responsible for the property in which the appliance is located/installed. A replacement copy can be obtained from the Vokèra website - www.vokera.co.uk.

Easi-Heat Plus Ci boiler complies with basic requirements of the following Directives:

- Regulation (EU) 2016/426;
- Yield directive: Article 7(2) and Annex III of directive 92/42/ FFC:
- Electromagnetic compatibility directive 2014/30/EU;
- Low-voltage directive 2014/35/EU;
- Directive 2009/125/EC Ecodesign for energy-using appliances;
- Regulation (EU) 2017/1369 Energy labeling;
- Delegated Regulation (EU) No. 811/2013;
- Delegated Regulation (EU) No. 813/2013;
- Delegated Regulation (EU) No. 814/2013.

At the end of its life, the product should be not be disposed of as solid urban waste, but rather it should be handed over to a differentiated waste collection centre.

Fig. 4

#### SECTION 1 - DESIGN PRINCIPLES AND OPERATING SEQUENCE

#### 1.1. PRINCIPLE COMPONENTS

- A fully integrated electronic control board featuring electronic temperature control, anti-cycle control, pump over-run, selfdiagnostic fault indicator, full air/gas modulation.
- · Aluminium heat exchanger.
- · Electronic ignition with flame supervision.
- · Integral high-head pump.
- Fan.
- Expansion vessel.
- · Water pressure switch.
- · Flue sensor.
- · Pressure gauge.
- · Safety valve.

#### 1.2. MODE OF OPERATION (at rest)

When the appliance is at rest and there are no requests for heating or hot water, the following functions are active:

- frost-protection system the frost-protection system protects the appliance against the risk of frost damage both for CH and DHW. For CH line, if the main temperature falls to 5 °C, the appliance will function on minimum power until the temperature on main reaches 35 °C.
  - Moreover if the DHW temperature falls to 5  $^{\circ}$ C, the appliance will function on minimum power until the temperature on main reaches 55  $^{\circ}$ C.
- anti-block function the anti-block function enables the pump and divertor valve actuator to be energised for short periods, when the appliance has been inactive for more than 24-hours.

#### 1.3. MODE OF OPERATION (Heating)

When there is a request for heat via the time clock and/or any external control, the pump and fan are started, the fan speed will modulate until the correct signal voltage is received at the control PCB. At this point an ignition sequence is enabled. Ignition is sensed by the electronic circuit to ensure flame stability at the burner. Once successful ignition has been achieved, the electronic circuitry increases the gas rate to 75% for a period of 15 minutes. Thereafter, the boiler's output will either be increase to maximum or modulate to suit the set requirement. When the appliance reaches the desired temperature the burner will shut down and the boiler will perform a three-minute anti-cycle (timer delay).

When the request for heat has been satisfied the appliance pump and fan may continue to operate to dissipate any residual heat within the appliance.

#### 1.4. MODE OF OPERATION (Hot water)

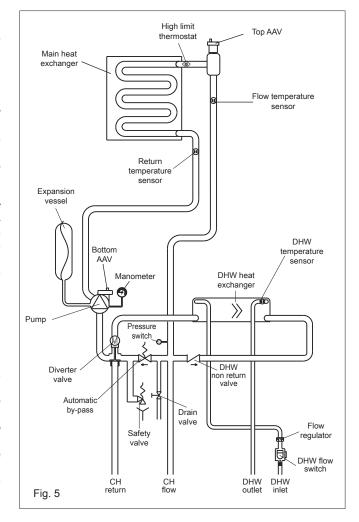

When there is a request for DHW via a hot water outlet or tap, the pump and fan are started, the fan speed will modulate until the correct signal voltage is received at the control PCB. At this point an ignition sequence is enabled.

Ignition is sensed by the electronic circuit to ensure flame stability at the burner. Once successful ignition has been achieved, the electronic circuitry increases the gas rate to maximum or will modulate output to stabilise the temperature. In the event of the appliance exceeding the desired temperature (set point) the burner will shut down until the temperature drops. When the request for DHW has been satisfied the appliance pump and fan may continue to operate to dissipate any residual heat within the appliance.

#### 1.5. SAFETY DEVICES

When the appliance is in use, safe operation is ensured by:

- a water pressure switch that monitors system water pressure and will de-activate the pump, fan, and burner should the system water pressure drop below the rated tolerance;
- · fan speed sensor to ensure safe operation of the burner;
- a high limit thermostat that over-rides the temperature control circuit to prevent or interrupt the operation of the burner;
- flame sensor that will shut down the burner when no flame signal is detected;
- · flue sensor;
- a safety valve which releases excess pressure from the primary circuit.

#### **SECTION 2 - TECHNICAL DATA**

2.1 Central Heating	Easi-Heat Plus 25Ci	Easi-Heat Plus 29Ci	Easi-Heat Plus 32Ci		
Heat input (kW)	20.00	25.00	25.00		
Maximum heat output (kW) 60/80°C	19.50	24.45	24.45

#### **SECTION 3 - GENERAL REQUIREMENTS (UK)**

This appliance must be installed by a competent person in accordance with the Gas Safety (Installation & Use) Regulations.

#### 3.1 RELATED DOCUMENTS

The installation of this boiler must be in accordance with the relevant requirements of the Gas Safety (Installation & Use) Regulations, the local building regulations, the current I.E.E. wiring regulations, the bylaws of the local water undertaking, the Building Standards (Scotland) Regulation and Building Standards (Northern Ireland) Regulations.

It should be in accordance also with any relevant requirements of the local authority and the relevant recommendations of the following British Standard Codes of Practice.

#### 3.2 LOCATION OF APPLIANCE

The appliance may be installed in any room or internal space, although particular attention is drawn to the requirements of the current I.E.E. wiring regulations, and in Scotland, the electrical provisions of the Building Regulations, with respect to the installation of the appliance in a room or internal space containing a bath or shower.

In cold and/or humid weather, water vapour will condense on leaving the terminal; the effect of such pluming must be considered.

If installed less than 2m above a pavement or platform to which people have access (including balconies or flat roofs) the terminal must be protected by a guard of durable material. The guard must be fitted centrally over the terminal. Refer to BS 5440 Part 1, when the terminal is 0.5 metres (or less) below plastic guttering or 1 metre (or less) below painted eaves.

#### 3.5 AIR SUPPLY

The following notes are intended for general guidance only. This appliance is a room-sealed, fan-flued boiler, consequently it does not require a permanent air vent for combustion air supply. When installed in a cupboard or compartment, ventilation for cooling purposes is also not required.

#### 3.6 WATER CIRCULATION

Detailed recommendations are given in BS 5449 Part 1 and BS 6798. The following notes are for general guidance only.

BS 5440	PART 1	FLUES
BS 5440	PART 2	FLUES & VENTILATION
BS 5449	PART 1	FORCED CIRCULATION HOT WATER SYSTEMS
BS 5546		INSTALLATION OF GAS HOT WATER SUPPLIES FOR DOMESTIC PURPOSES
BS 6798		INSTALLATION OF BOILERS OF RATED INPUT NOT EXCEEDING 60kW
BS 6891		LOW PRESSURE INSTALLATION PIPES
BS 7074	PART 1	APPLICATION, SELECTION, AND INSTALLTION OF EXPANSION VESSELS AND
DS 1014	PARII	ANCILLARY EQUIPMENT FOR SEALED WATER SYSTEMS

When an appliance is installed in a room or internal space containing a bath or shower, the appliance or any control pertaining to it must not be within reach of a person using the bath or shower. The location chosen for the appliance must permit the provision of a safe and satisfactory flue and termination. The location must also permit an adequate air supply for combustion purposes and an adequate space for servicing and air circulation around the appliance. Where the installation of the appliance will be in an unusual location special procedures may be necessary, BS 6798 gives detailed guidance on this aspect. A compartment used to enclose the appliance must be designed and constructed specifically for this purpose. An existing compartment/cupboard may be utilised provided that it is modified to suit. Details of essential features of compartment/cupboard design including airing cupboard installations are given in BS 6798. This appliance is not suitable for external installation.

#### 3.3 GAS SUPPLY

The gas meter – as supplied by the gas supplier – must be checked to ensure that it is of adequate size to deal with the maximum rated input of all the appliances that it serves. Installation pipes must be fitted in accordance with BS 6891.

Pipe work from the meter to the appliance must be of adequate size. Pipes of a smaller size than the appliance gas inlet connection must not be used. The installation must be tested for soundness in accordance with BS6891.

If the gas supply serves more than one appliance, it must be ensured that an adequate supply is maintained to each appliance when they are in use at the same time.

#### NOTE

It is recognised that 'pressure loss' through the gas cock and gas valve may result in a pressure drop of approximately 2mbar between the gas meter and gas valve inlet test point; this will not impair the performance of the appliance, provided that a dynamic pressure of 18mbar is available at the appliance inlet.

#### 3.4 FLUE SYSTEM

The terminal should be located where the dispersal of combustion products is not impeded and with due regard for the damage and discoloration that may occur to building products located nearby. The terminal must not be located in a place where it is likely to cause a nuisance (see fig. 7).

#### 3.6.1 PIPEWORK

It is recommended that copper tubing to BS 2871 Part 1 is used in conjunction with soldered capillary joints. Where possible pipes should have a gradient to ensure air is carried naturally to air release points and that water flows naturally to drain cocks. Except where providing useful heat, pipes should be insulated to avoid heat loss and in particular to avoid the possibility of freezing. Particular attention should be paid to pipes passing through ventilated areas such as under floors, loft space and void areas.

#### 3.6.2 AUTOMATIC BY-PASS

The appliance has a built-in automatic by-pass, consequently there is no requirement for an external by-pass, however the design of the system should be such that it prevents boiler 'cycling'.

#### 3.6.3 DRAIN COCKS

These must be located in accessible positions to facilitate draining of the appliance and all water pipes connected to the appliance. The drain cocks must be manufactured in accordance with BS 2879.

#### 3.6.4 AIR RELEASE POINTS

These must be positioned at the highest points in the system where air is likely to be trapped. They should be used to expel trapped air and allow complete filling of the system.

#### 3.6.5 EXPANSION VESSEL

The appliance has an integral expansion vessel to accommodate the increased volume of water when the system is heated. It can accept up to 8 litres of expansion from within the system, generally this is sufficient, however if the system has an unusually high water content, it may be necessary to provide additional expansion capacity (see 6.18).

#### 3.6.6 FILLING POINT

A method for initial filling of the system and replacing water lost during servicing etc. directly from the mains supply, must be provided (see fig. 8). This method of filling complies with the current Water Supply (Water Fittings) Regulations 1999 and Water Bylaws 2000 (Scotland). If an alternative location is preferred, it should be connected as detailed in fig. 8.

#### 3.6.7 LOW PRESSURE SEALED SYSTEM

An alternative method of filling the system would be from an independent make-up vessel or tank mounted in a position at least 1 metre above the highest point in the system and at least 5 metres above the boiler (see fig. 9).

The cold feed from the make-up vessel or tank must be fitted with an approved non-return valve and stopcock for isolation purposes. The feed pipe should be connected to the return pipe as close to the boiler as possible.

#### 3.6.8 FREQUENT FILLING

Frequent filling or venting of the system may be indicative of a leak. Care should be taken during the installation of the appliance to ensure all aspects of the system are capable of withstanding pressures up to at least 3 bar.

#### 3.7 ELECTRICAL SUPPLY

The appliance is supplied for operation on 230V @ 50Hz electrical supply; it must be protected with a 3-amp fuse. The method of connection to the mains electricity supply must allow for complete isolation from the supply. The preferred method is by using a double-pole switch with a contact separation of at least 3,5mm (3° high-voltage category). The switch must only supply the appliance and its corresponding controls, i.e. time clock, room thermostat, etc. Alternatively an un-switched shuttered socket with a fused 3-pin plug both complying with BS 1363 is acceptable.

#### **NOTE**

Vokera Ltd. cannot guarantee the performance or reliability of the appliance if/when it is supplied via an invertor or generator; in particular those that incorporate a 'floating' earth or 'modified' sine wave.

#### 3.8 MOUNTING ON A COMBUSTIBLE SURFACE

If the appliance is to be fitted on a wall of combustible material, There is no requirement to protect the wall.

#### 3.9 TIMBER FRAMED BUILDINGS

If the appliance is to be fitted in a timber framed building, it should be fitted in accordance with the Institute of Gas Engineers publication (IGE/UP/7) 'Guide for Gas Installations in Timber Frame Buildings'.

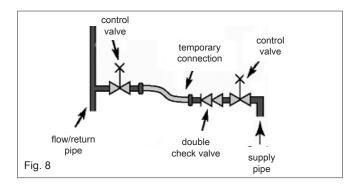

#### 3.10 WATER TREATMENT

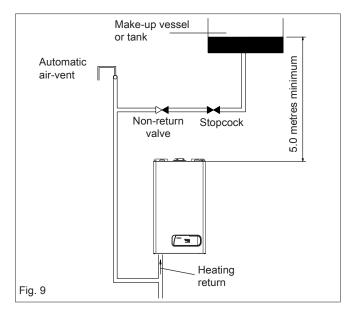

Vokera recommend that water treatment be carried out in accordance with the Benchmark Guidance on water treatment in central heating systems. If water treatment products are to be used, then they must be entirely suitable for use with an aluminium heat exchanger. Any water treatment product, must be administered in strict accordance with the manufacturer's instructions.

If the appliance is to be installed to an existing system; water treatment and flushing of the complete heating system should be carried out in accordance with BS 7593 and the Benchmark Guidance on water treatment in central heating systems.

#### 3.11 SHOWERS

If the appliance is intended for use with a shower, the shower must be thermostatically controlled and be suitable for use with a combination boiler.

#### **SECTION 3A - GENERAL REQUIREMENTS (EIRE)**

This appliance must be installed by a competent person in accordance with and defined by, the Standard Specification (Domestic Gas Installations) Declaration (I.S. 813).

#### **3A.1 RELATED DOCUMENTS**

The installation of this boiler must be in accordance with the relevant requirements of the local building regulations, the current ETCI National Rules for Electrical Installations and the bylaws of the local water undertaking.

It should be in accordance also with any relevant requirements of the local and/or district authority.

#### **3A.2 LOCATION OF APPLIANCE**

The appliance may be installed in any room or internal space, although particular attention is drawn to the requirements of the current ETCI National Rules for Electrical Installations, and I.S. 813, Annex K.

When an appliance is installed in a room or internal space containing a bath or shower, the appliance or any control pertaining to it must not be within reach of a person using the bath or shower. The location chosen for the appliance must permit the provision of a safe and satisfactory flue and termination. The location must also permit an adequate air supply for combustion purposes and an adequate space for servicing and air circulation around the appliance. Where the installation of the appliance will be in an unusual location special procedures may be necessary, refer to I.S. 813 for detailed guidance on this aspect.

A compartment used to enclose the appliance must be designed and constructed specifically for this purpose. An existing compartment/cupboard may be utilised provided that it is modified to suit.

This appliance is not suitable for external installation.

#### **3A.3 GAS SUPPLY**

The gas meter – as supplied by the gas supplier – must be checked to ensure that it is of adequate size to deal with the maximum rated input of all the appliances that it serves. Installation pipes must be fitted in accordance with I.S. 813.

Pipe work from the meter to the appliance must be of adequate size. Pipes of a smaller size than the appliance gas inlet connection must not be used. The installation must be tested for soundness in accordance with I.S. 813.

If the gas supply serves more than one appliance, it must be ensured that an adequate supply is maintained to each appliance when they are in use at the same time.

#### NOTE

It is recognised that 'pressure loss' through the gas cock and gas valve may result in a pressure drop of approximately 2mbar between the gas meter and gas valve inlet test point; this will not impair the performance of the appliance, provided that a dynamic pressure of 18mbar is available at the appliance inlet.

#### 3A.4 FLUE SYSTEM

The terminal should be located where the dispersal of combustion products is not impeded and with due regard for the damage and discoloration that may occur to building products located nearby. The terminal must not be located in a place where it is likely to cause a nuisance (see I.S. 813).

In cold and/or humid weather, water vapour will condense on leaving the terminal; the effect of such pluming must be considered.

If installed less than 2m above a pavement or platform to which people have access (including balconies or flat roofs) the terminal must be protected by a guard of durable material. The guard must be fitted centrally over the terminal. Refer to I.S. 813, when the terminal is 0.5 metres (or less) below plastic guttering or 1 metre (or less) below painted eaves.

#### **3A.5 AIR SUPPLY**

The following notes are intended for general guidance only. This appliance is a room-sealed, fan-flued boiler, consequently it does not require a permanent air vent for combustion air supply. When installed in a cupboard or compartment, ventilation for cooling purposes is also not required.

#### 3A.6 WATER CIRCULATION

Specific recommendations are given in I.S. 813. The following notes are for general guidance only.

#### 3A.6.1 PIPEWORK

It is recommended that copper tubing be used in conjunction with soldered capillary joints.

Where possible pipes should have a gradient to ensure air is carried naturally to air release points and that water flows naturally to drain cocks.

Except where providing useful heat, pipes should be insulated to avoid heat loss and in particular to avoid the possibility of freezing. Particular attention should be paid to pipes passing through ventilated areas such as under floors, loft space and void areas.

#### 3A.6.2 AUTOMATIC BY-PASS

The appliance has a built-in automatic by-pass, consequently there is no requirement for an external by-pass, however the design of the system should be such that it prevents boiler 'cycling'.

#### **3A.6.3 DRAIN COCKS**

These must be located in accessible positions to facilitate draining of the appliance and all water pipes connected to the appliance.

#### **3A.6.4 AIR RELEASE POINTS**

These must be positioned at the highest points in the system where air is likely to be trapped. They should be used to expel trapped air and allow complete filling of the system.

#### 3A.6.5 EXPANSION VESSEL

The appliance has an integral expansion vessel to accommodate the increased volume of water when the system is heated. It can accept up to 8 litres of expansion from within the system, generally this is sufficient, however if the system has an unusually high water content, it may be necessary to provide additional expansion capacity (see 6.18).

#### **3A.6.6 FILLING POINT**

A method for initial filling of the system and replacing water lost during servicing etc. must be provided (see fig. 8). You should ensure this method of filling complies with the local water authority regulations.

#### 3A.6.7 LOW PRESSURE SEALED SYSTEM

An alternative method of filling the system would be from an independent make-up vessel or tank mounted in a position at least 1 metre above the highest point in the system and at least 5 metres above the boiler (see fig. 9). The cold feed from the make-up vessel or tank must be fitted with an approved non-return valve and stopcock for isolation purposes. The feed pipe should be connected to the return pipe as close to the boiler as possible.

#### 3A.6.8 FREQUENT FILLING

Frequent filling or venting of the system may be indicative of a leak. Care should be taken during the installation of the appliance to ensure all aspects of the system are capable of withstanding pressures up to at least 3 bar.

#### 3A.7 ELECTRICAL SUPPLY

The appliance is supplied for operation on 230V @ 50Hz electrical supply; it must be protected with a 3-amp fuse. The method of connection to the mains electricity supply must allow for complete isolation from the supply. The preferred method is by using a double-pole switch with a contact separation of at least 3,5 mm (3° high-voltage category). The switch must only supply the appliance and its corresponding controls, i.e. time clock, room thermostat, etc.

#### NOTE

Vokera Ltd. cannot guarantee the performance or reliability of the appliance if/when it is supplied via an invertor or generator; in particular those that incorporate a 'floating' earth or 'modified' sine wave.

#### 3A.8 MOUNTINGONACOMBUSTIBLESURFACE

If the appliance is to be fitted on a wall of combustible material, There is no requirement to protect the wall.

#### **3A.9 TIMBER FRAMED BUILDINGS**

If the appliance is to be fitted in a timber framed building, it should be fitted in accordance with I.S. 813 and local Building Regulations.

The Institute of Gas Engineers publication (IGE/UP/7) 'Guide for Gas Installations in Timber Frame Buildings' gives specific advice on this type of installation.

#### 3A.10 WATER TREATMENT

Vokera recommend that water treatment be carried out in accordance with the Benchmark Guidance on water treatment in central heating systems. If water treatment products are to be used, then they must be entirely suitable for use with an aluminium heat exchanger. Any water treatment product, must be administered in strict accordance with the manufacturer's instructions.

If the appliance is to be installed to an existing system; water treatment and flushing of the complete heating system should be carried out in accordance with BS 7593 and the Benchmark Guidance on water treatment in central heating systems.

#### **3A.11 SHOWERS**

If the appliance is intended for use with a shower, the shower must be thermostatically controlled and be suitable for use with a combination boiler.

#### **3A.12 DECLARATION OF CONFORMITY**

A Declaration of Conformity (as defined in I.S. 813) must be provided on completion of the installation.

A copy of the declaration must be given to the responsible person and also to the gas supplier if required.

#### **SECTION 4 - INSTALLATION**

#### 4.1 DELIVERY

Due to the weight of the appliance it may be necessary for two people to lift and attach the appliance to its mounting. The appliance is contained within a heavy-duty cardboard carton. Lay the carton on the floor with the writing the correct way up.

#### 4.2 CONTENTS

Contained within the carton is:

- the boiler
- the wall bracket
- · carton template
- an accessories pack containing appliance service connections and washers
- the instruction pack containing the installation, servicing & user instructions, guarantee registration card and a 3-amp fuse.

#### 4.3 UNPACKING

At the top of the carton pull both sides open – do not use a knife – unfold the rest of the carton from around the appliance, carefully remove all protective packaging from the appliance and lay the accessories etc. to one side. Protective gloves should be used to lift the appliance, the appliance back-frame should be used for lifting points.

### 4.4 PREPARATION FOR MOUNTING THE APPLIANCE

The appliance should be mounted on a smooth, vertical, noncombustible surface, which must be capable of supporting the full weight of the appliance. Care should be exercised when determining the position of the appliance with respect to hidden obstructions such as pipes, cables, etc.

When the position of the appliance has been decided – using the template supplied – carefully mark the position of the wall-mounting bracket (see fig. 10) and flue-hole (if applicable).

#### 4.5 FITTING THE FLUE

The top flue outlet permits both horizontal and vertical flue applications to be considered, alternatively, the Vokèra twin flue system can be utilised if longer flue runs are required.

#### 4.5.1 CONCENTRIC HORIZONTAL FLUE

(For concentric vertical flue, see 4.5.2).

The appliance can be used with either the Vokera condensing 60/100mm concentric flue system or the optional 80/125mm concentric flue system.

#### NOTE

These instructions relate **only** to the Vokèra condensing 60/100mm concentric flue system. For specific details on the installation of the 80/125mm concentric flue system please refer to the instructions supplied. The appliance flue outlet elbow can be rotated through 360° on its vertical axis. In addition the flue may be extended from the outlet elbow in the horizontal plane (see 2.9). A reduction must also be made to the maximum length (see table below) when additional bends are used.

#### Reduction for additional bends

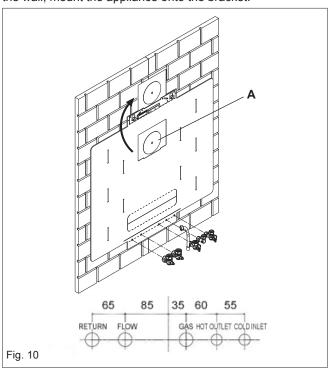

Bend	Reduction in maximum flue length for each bend	
45° bend	1.0 metre (60/100) - 1.0 metre (80/125)	
90° bend	1.0 metre (60/100) - 1.0 metre (80/125)	

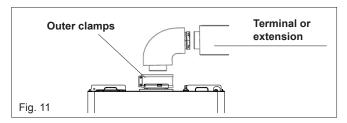

#### Horizontal flue terminals and accessories

Code	Description	Length
20132063	Standard horizontal flue kit	900mm
20131981	Telescopic flue kit	700mm
20132059	90-degree bend	N/A
20132058	45-degree bends (2)	N/A
20132060	500mm extension	500mm
20132061	1000mm extension	1000mm
20132062	2000mm extension	2000mm

20131979	Telescopic extension	372/519mm
522	Plume management kit	1370mm
20135587	100mm flue brackets (5)	N/A

Using the template provided (A), mark and drill a 125mm hole for the passage of the flue pipe. The hole should be drilled to ensure any condense fluid that forms, is allowed to drain back to the appliance (see fig. 12). The fixing holes for the wall-mounting bracket should now be drilled and plugged, an appropriate type and quantity of fixing should be used to ensure that the bracket is mounted securely. Once the bracket has been secured to the wall, mount the appliance onto the bracket.

#### FITTING THE TELESCOPIC HORIZONTAL FLUE KIT

In some instances It may necessary to cut the inner 60mm pipe of the flue bend at the point indicated (fig.13 pos. A) to allow for easier insertion to the boiler flue spigot.

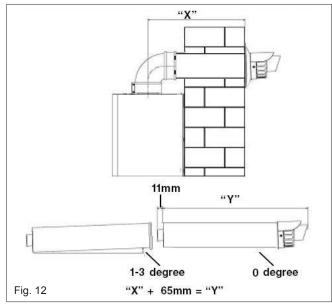

#### FITTING THE HORIZONTAL FLUE KIT

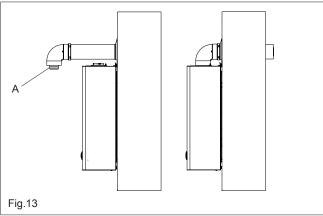

Carefully measure the distance from the centre of the appliance flue outlet to the edge of the finished outside wall (dimension X). Add 65mm to dimension X to give you dimension Y (see fig 12). Measure dimension Y from the terminal end of the concentric flue pipe and cut off the excess ensuring any burrs are removed. Pass the concentric flue pipe through the previously drilled hole. Fit the flue bend to the boiler flue outlet and insert the concentric flue pipe into the flue bend ensuring the correct seal is made. Using the clamp, gasket, and screws supplied, secure the flue bend to the appliance flue spigot.

#### NOTE

Fit the internal (white) trim to the flue assembly prior to connecting the flue pipe to the bend.

You must ensure that the entire flue system is properly supported and connected. Seal the flue assembly to the wall using cement or a suitable alternative that will provide satisfactory weatherproofing. The exterior trim can now be fitted.

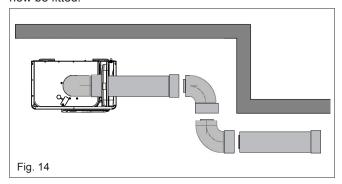

#### **EXTENDING THE FLUE**

Connect the bend – supplied with the terminal kit – to the top of the boiler using clamp (supplied) see fig. 11. The additional bends & extensions have push-fit connections, care should be taken to ensure that the correct seal is made when assembling the flue system. Connect the required number of flue extensions or bends (up to the maximum equivalent flue length) to the flue terminal (see fig. 11-15). Each horizontal terminal, incorporates an incline on the inner (60mm) pipe; this enables the terminal to be installed on a level plane. However any extended horizontal flue runs must incorporate a 3-degree fall-back from the flue terminal towards the appliance.

#### NOTE

When cutting an extension to the required length, you must ensure that the excess is cut from the plain end of the extension (see fig. 11-15). Remove any burrs, and check that all seals are located properly. You must ensure that the entire flue system is properly supported and connected. Seal the flue assembly to the wall using cement or a suitable alternative that will provide satisfactory weatherproofing. The interior and exterior trim can now be fitted.

#### 4.5.2 CONCENTRIC VERTICAL FLUE

The appliance can be used with either the Vokèra condensing 60/100mm concentric flue system or the optional 80/125mm concentric flue system.

#### NOTE

These instructions relate **only** to the Vokèra condensing 60/100mm concentric flue system. For specific details on the installation of the 80/125mm concentric flue system please refer to the instructions supplied. The vertical flue terminal can be connected directly to the appliance flue outlet. Alternatively, an extension or bend can be connected to the appliance flue outlet if desired, however if additional bends are fitted, a reduction must be made to the maximum flue length (see table below).

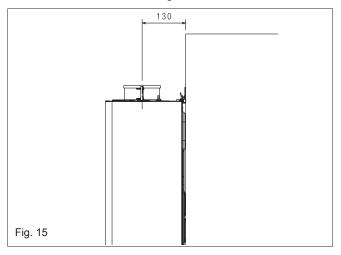

#### Reduction for bends

Bend	Reduction in maximum flue length for each bend		
45° bend	1.0 metre (60/100) - 1.0 metre (80/125)		
90° bend	1.0 metre (60/100) - 1.0 metre (80/125)		

#### Vertical flue terminal and accessories

Part No.	Description	Length
20131983	Vertical flue kit	1000mm
20132059	90-degree bend	N/A
20132058	45-degree bends (2)	N/A
20132060	500mm extension	500mm
20132061	1000mm extension	1000mm
20132062	1000mm extension	2000mm
20131979	Telescopic extension	372/519mm
20135587	100mm flue brackets (5)	N/A
20132050	Pitched roof flashing	N/A
20135582	Flat roof flashing	N/A

Using the dimensions given in fig. 12 as a reference, mark and cut a 125mm hole in the ceiling and/or roof.

Fit the appropriate flashing plate to the roof and insert the vertical flue terminal through the flashing plate from the outside, ensuring that the collar on the flue terminal fits over the flashing. The fixing holes for the wall-mounting bracket should now be drilled and plugged, an 'appropriate type and quantity of fixing should be used to ensure that the bracket is mounted securely. Once the bracket has been secured to the wall, mount the appliance onto the bracket.

#### **IMPORTANT**

The vertical flue terminal is 1.0 metre in length and cannot be cut; therefore it may be necessary to adjust the height of the appliance to suit or use a suitable extension.

Connect the vertical flue assembly to the boiler flue spigot using the 100mm clip, gasket & screws (supplied), ensuring the correct seal is made. The flue support bracket (supplied with the vertical flue kit) can now be fitted.

If the vertical flue requires extension/s or additional bend/s, connect the required number of flue extensions or bends (up to the maximum equivalent flue length) between the boiler and vertical flue assembly.

Ensure that any horizontal flue sections incorporate a 3-degree fall-back from the flue terminal towards the appliance.

#### NOTE

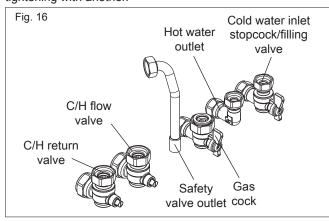

When cutting an extension to the required length, you must ensure that the excess is cut from the plain end of the extension. Remove any burrs, and check that any seals are located properly. You must ensure that the entire flue system is properly supported and connected.

#### 4.6 CONNECTING THE GAS AND WATER

The appliance is supplied with an accessory pack that includes service valves. The service valves have 'end-feed' connections that require to be soldered. The accessory pack contains sealing washers' etc, for use with the service valves.

#### **NOTE**

It will be necessary to hold the valve with one spanner whilst tightening with another.

#### 4.6.1 GAS (fig. 16)

The appliance is supplied with a 22mm service valve, connect a 22mm pipe to the inlet of the valve and tighten both nuts.

It will be necessary to calculate the diameter of the gas supply pipe to ensure the appliance has an adequate supply of gas.

**4.6.2 FLOW & RETURN (fig. 16)**The appliance is supplied with 22mm service valves for the flow and return connections, connect a 22mm pipe to the inlet of each valve and tighten both nuts.

Depending on system requirements, it may necessary to increase the size of the flow & return pipe work after the service valve connections.

**4.6.3 COLD WATER INLET (fig. 16)**The appliance is supplied with a 15mm combined stopcock, connect a 15mm pipe to the inlet of the stopcock and tighten both nuts.

**4.6.4 HOT WATER OUTLET (fig. 16)**The appliance is supplied with a 15mm outlet connection, connect a 15mm pipe to the outlet connection and tighten both nuts.

#### 4.6.5 SAFETY VALVE (fig. 16)

Connect the safety valve connection pipe to the safety valve outlet. Connect a discharge pipe to the other end of the safety valve connection pipe and tighten. The discharge pipe must have a continuous fall away from the appliance to outside and allow any water to drain away thereby eliminating the possibility of freezing. The discharge pipe must terminate in a position where any water - possibly boiling - discharges safely without causing damage or injury, but is still visible.

#### 4.6.6 CONDENSE PIPE

This appliance will - under normal operating conditions produce condensate fluid that will require to be disposed of via the dwelling's waste water drainage system.

Vokera strongly recommends that the condensate pipe is connected to the internal waste water pipework in accordance with BS6798. BS6798 provides comprehensive instruction and advice on all permissible condensate disposal methods; notwithstanding this, it is essential that the following is strictly adhered to:

- use only plastic drainage pipe (minimum OD of 21.5mm)
- horizontal runs must incorporate a minimum 45mm fall per metre, away from the appliance
- external pipework and/or pipework in unheated areas, must have a minimum OD of 32mm and be insulated with Class-O pipe insulation
- the route, type, and termination of the condensate disposal method, must not permit any spillage of condensate fluid, into the dwelling in the event of a blockage or freezing of the condesate pipework.

Should it not be possible to route and terminate the condensate pipework internally using 'gravity discharge'; Vokera recommends that the Vokera condensate pump (code 404) be considered as an alternative solution.

Ensure that the end-user is aware of the effect/consequences of the condensate pipework becoming blocked or frozen.

#### 4.6.7 CONNECTING THE CONDENSATE OUTLET

Connect the flexible condense outlet pipe supplied in the carton to the condense trap inside the boiler, care should be taken to ensure that the trap connections are not disturbed.

Connect a suitable plastic (not copper) pipe (no less than 20mm diameter) to the outlet pipe and ensure it discharges in accordance with building regulations or other rules in force.

#### **ELECTRICAL CONNECTIONS**

The boiler is supplied with a fly-lead. This lead can be used for connection to the electrical supply. Connect the fly-lead to a fused plug or fused isolator in the following way:

- brown wire to LIVE supply
- blue wire to NEUTRAL supply
- green/yellow to EARTH connection.

Insert the supplied 3-AMP fuse into the fused isolator or fused plug. Should the fly-lead be unsuitable, refer to 4.7.3 for details on how to connect the electrical supply directly to the boiler.

The electrical supply must be as specified in section 3/3A. A qualified electrician should connect the appliance to the electrical supply. If controls - external to the appliance - are required, a competent person must undertake the design of any external electrical circuits, please refer to section 8 for detailed instructions. ANY EXTERNAL CONTROL OR WIRING MUST BE SERVED FROM THE SAME ISOLATOR AS THAT OF THE APPLIANCE. The supply cable from the isolator to the appliance must be 3-core flexible sized 0.75mm to BS 6500 or equivalent. Wiring to the appliance must be rated for operation in contact with surfaces up to 90 °C.

#### 4.7.1 CASING REMOVAL (fig. 17)

To gain internal access to the appliance you must first remove the casing, proceed as outlined below:

- locate and unscrew the 2-screws (A) that secure the outer casing to the appliance
- lift the casing upward to disengage it from the top locating hooks and then remove
- store the casing and screws safely until required. Re-fit in the reverse order
- gently lower the control fascia until it rests.

#### 4.7.2 APPLIANCE TERMINAL BLOCK

The appliance terminal block is located on the rear of the control fascia. Remove the casing as described in 4.7.1. Gently pull the control panel forwards and down. Locate the terminal block cover (fig. 18).

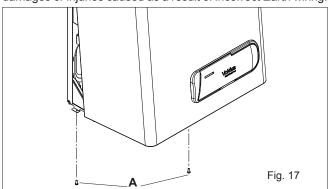

If it is anticipated that external controls will be required please refer to the wiring diagrams in section 8 for more detailed information.

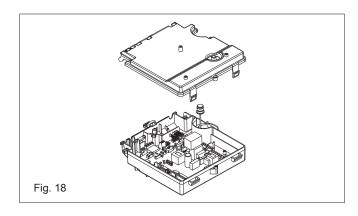

#### 4.7.3 CONNECTING THE MAINS (230V) INPUT

Unhook and remove the terminal block cover (230V). Pass the cable through the cable anchorage point. Connect the supply cable wires (LIVE, NEUTRAL, & EARTH) to their corresponding terminals (L, N, & E) on the appliance - high voltage - terminal block. When connecting the EARTH wire, ensure that it's left slightly longer that the others, this will prevent strain on the EARTH wire should the cable become taut. Do not remove the link wire (CN5) unless additional external controls are to be fitted (see section 8). The securing screw on the cable anchorage should now be tightened. This must be done before the terminal block cover is re-fitted in its position.

#### NOTE

It is the installer's responsibility to ensure that the appliance is properly Earthed. Vokèra Ltd. cannot be held responsible for any damages or injuries caused as a result of incorrect Earth wiring.

#### **SECTION 5 - COMMISSIONING**

#### 5.1 GAS SUPPLY INSTALLATION

Inspect the entire installation including the gas meter, test for tightness and purge. Refer to BS 6891 (I.S. 813 in ROI) for specific instruction.

#### 5.2 THE HEATING SYSTEM

The appliance contains components that may become damaged or rendered inoperable by oils and/or debris that are residual from the installation of the system, consequently it is essential that the system be flushed in accordance with the following instructions.

#### 5.3 FILL THE CONDENSATE TRAP

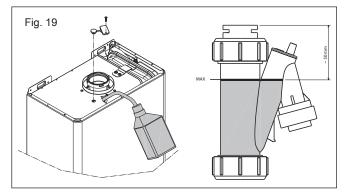

The first time you turn the boiler on after a prolonged period of inactivity or for maintenance work, before using the appliance you must fill the siphon with water and make sure that the condensate is evacuated correctly.

Fill the condensation collection siphon pouring 1 litre of water into the boiler combustion-analysis outlet with the boiler off, and check that:

- the safety cut-off device (internal float) is floating
- water is flowing correctly from the discharge pipe out of the hoiler
- the condensate outlet connection line is watertight

If the condensate outlet circuit (siphon and pipes) is working correctly, the condensation level will not exceed the maximum. Filling the siphon before using the appliance, and the use of a safety cut-off device inside the siphon, prevent exhaust gases from being released into the environment.

Repeat during standard and non-standard maintenance work.

#### 5.4 INITIAL FILLING OF THE SYSTEM

Ensure both flow and return service valves are open, remove appliance casing as described in 4.7.1, identify the automatic air release valves (AAV) and loosen the dust cap/s by turning the cap anti-clockwise one full turn. Ensure all manual air release valves located on the heating system are closed. Connect the filling loop as shown in fig. 5, slowly proceed to fill the system by firstly opening the inlet valve connected to the flow pipe, and then turning the lever on the fill valve, to the open position. As water enters the system the pressure gauge will begin to rise. Once the gauge has reached 1 BAR close both valves and begin venting all manual air release valves, starting at the lowest first. It may be necessary to go back and top-up the pressure until the entire system has been filled. Inspect the system for water tightness, rectifying any leaks.

#### 5.5 INITIAL FLUSHING OF THE SYSTEM

The whole of the heating system must be flushed both cold and hot as detailed in 5.9. Open all radiator or heating valves and the appliance flow & return service valve. Drain the boiler and system from the lowest points. Open the drain valve full bore to remove any installation debris from the boiler prior to lighting. Refill the boiler and heating system as described previously.

#### 5.6 PRE-OPERATION CHECKS

Before attempting the initial lighting of the appliance, the following checks must be carried out:

- ensure all gas service valves from the meter to the appliance are open and the supply pipe has been properly purged:
- are open and the supply pipe has been properly purged;

  ensure the proper electrical checks have been carried out, (see 7.8) particularly continuity, polarity and resistance to earth:
- ensure the 3 AMP fuse supplied with the appliance has been fitted:
- ensure the system has been filled, vented and the pressure set to 1 BAR;
- ensure the flue system has been fitted properly and in accordance with the instructions;
- · ensure all appliance service valves are open.

#### 5.7 INITIAL LIGHTING

Ensure the electrical supply to the appliance is switched on. Ensure any external controls are switched to an 'ON' position and are calling for heat. Move the selector switch to the ON position, the appliance will now operate as described in 1.2. Should the appliance fail to ignite, refer to 5.6 and/or section 7 (mode of operation, parameter setting & faultfinding).

### 5.8 CHECKING GAS PRESSURE AND COMBUSTION ANALYSIS

The appliance is factory set so should require no additional adjustment once installed. However to satisfy the requirements of GSIUR 26/9 (I.S. 813 ROI), it will be necessary to gas rate the appliance using the gas meter that serves the appliance and carry out a combustion analysis check in accordance with BS 7967 (UK) to ensure that correct combustion is occurring.

Additionally, if the gas valve has been adjusted, replaced, or the appliance has been converted for use with another gas type, then it becomes necessary to carry out a combustion analysis check to ensure that correct combustion is occurring. If there are no means to carry out a combustion analysis check, then it will not be possible to complete the commissioning procedure.

Details on how to carry out the combustion analysis can be found in section 7.

#### IMPORTANT

It's imperative that a sufficient dynamic – gas – pressure is maintained at all times. Should the dynamic gas pressure fall below an acceptable level, the appliance may malfunction or sustain damage.

#### 5.9 FINAL FLUSHING OF THE HEATING SYSTEM

The system shall be flushed in accordance with BS 7593 (I.S. 813 ROI). Should a cleanser be used, it must be suitable for Aluminium heat exchangers. It shall be from a reputable manufacturer and shall be administered in strict accordance with the manufacturers' instructions and the DWTA code of practice.

#### **NOTE**

Chemicals used to cleanse the system and/or inhibit corrosion must be pH neutral, i.e. they should ensure that the level of the pH in the system water remains neutral. Premature failure of certain components can occur if the level of pH in the system water is out-with normal levels.

#### 5.9.1 INHIBITORS

See Section 3 "General Requirements".

### 5.10 SETTING THE FLOW OUTLET TEMPERATURE

The flow outlet temperature can be adjusted between 40 °C - 80 °C for standard CH system by using the Heating thermostat knob (see fig.1).

#### 5.10.1SETTING THE DHW OUTLET TEMPERATURE

The DHW outlet temperature can be adjusted between 37 °C - 60 °C via the DHW thermostat knob (see fig.1).

#### 5.11 SETTINGTHESYSTEMDESIGNPRESSURE

The design pressure should be a minimum of 0.5 BAR and a maximum of 1.5 BAR. The actual reading should ideally be 1 BAR plus the equivalent height in metres (0.1 BAR = 1 metre) to the highest point in the system above the base of the appliance (up to the maximum of 1.5 BAR total). **N.B.** The safety valve is set to lift at 3 BAR/30 metres/45 psig. To lower the system pressure to the required value, drain off some water from the appliance drain valve until the required figure registers on the pressure gauge (see fig. 1).

### 5.12 REGULATING THE CENTRAL HEATING SYSTEM

Fully open all radiator and circuit valves and run the appliance for both heating and hot water until heated water is circulating. If conditions are warm remove any thermostatic heads. Adjust radiator return valves and any branch circuit return valves until the individual return temperatures are correct and are approximately equal.

#### 5.12.1 REGULATING THE DHW FLOW-RATE

The appliance is fitted with a flow rate restrictor that limits the maximum flow rate that can be drawn through the appliance. The restrictor eliminates the need to manually adjust the DHW flow rate. However if it is felt necessary to further increase or decrease the available flow rate, spare restrictors are available to Vokèra spare parts. The spare flow rate restrictors can be fitted to either increase or decrease the maximum flow rate.

#### **5.12.2 FLOW-RATE RESTRICTOR**

The boiler is supplied with the following flow restrictor.

Easi-Heat Plus 25Ci: 8 - litres flow restrictor Easi-Heat Plus 29Ci: 10 - litres flow restrictor. Easi-Heat Plus 32Ci: 11 - litres flow restrictor.

#### 5.13 FINAL CHECKS

- ENSURE ALL TEST NIPPLES ON THE APPLIANCE GAS VALVE ARE TIGHT AND CHECKED FOR TIGHTNESS.
- ENSURE THE APPLIANCE FLUE SYSTEM IS FITTED CORRECTLY AND IS PROPERLY SECURED.
- ENSURE ALL PIPE WORK IS RE-CHECKED FOR TIGHT-NESS.
- RE-FIT APPLIANCE CASING
- COMPLETE BENCHMARK CHECKLIST.

#### FOR UK ONLY

Complete details of the boiler, controls, installation and commissioning in the Benchmark checklist at the back of this book. It is important that the Benchmark checklist is correctly completed and handed to the user. Failure to install and commission the appliance to the manufacturers instructions will invalidate the warranty.

#### 5.14 INSTRUCTING THE USER

Hand over all documentation supplied with this appliance – including these instructions – and explain the importance of keeping them in a safe place.

Explain to the user how to isolate the appliance from the gas, water and electricity supplies and the locations of all drain points. Show the user how to operate the appliance and any associated controls correctly.

Show the user the location of the filling valve and how to topup the system pressure correctly and show the location of all manual air release points.

Explain to the user how to turn off the appliance for both long and short periods and advise on the necessary precautions to prevent frost damage.

Explain to the user that for continued safe and efficient operation, the appliance must be serviced annually by a competent person.

#### **IMPORTANT**

To validate the appliance warranty, it's necessary to register the appliance details with us. The warranty can be registered in several ways:

- by completing the warranty registration card and posting to us using the envelope supplied
- · online at: vokera.co.uk
- for UK residents by calling: 0870 607 0281
- for ROI residents by calling: 056 6655057.

#### **SECTION 6 - SERVICING INSTRUCTIONS**

#### 6.1 GENERAL

Once the appliance has been serviced, the benchmark Service Record must be completed.

For UK only: It is important that the Benchmark Service Record is correctly completed and handed to the user. Failure to install and commission the appliance to the manufacturers instructions will invalidate the warranty.

To ensure the continued safe and efficient operation of the appliance, it is recommended that it is checked and serviced at regular intervals. To ensure correct and safe operation of the appliance, it is essential that any worn or failed component be replaced only with a **genuine Vokèra spare part**. It should be remembered that although certain generic components may look similar, they will be specific to an individual appliance or product range. Use of non-genuine Vokèra spare parts could invalidate your warranty and may pose a potential safety hazard. The frequency of servicing will depend upon the particular installation conditions, but in general, once per year should be sufficient. It is the law that any servicing work is carried out by competent person such as a Vokèra engineer, an approved service agent, British Gas, GAS SAFE registered personnel or other suitably qualified personnel. The following instructions apply to the appliance and its controls, but it should be remembered that the central heating and the domestic hot water systems would also require attention from time to time.

#### **6.2 ROUTINE ANNUAL SERVICING**

- Check the operation of the appliance and ensure it functions as described in section 7.
- Compare the performance of the appliance with its design specification. The cause of any noticeable deterioration should be identified and rectified without delay.
- Thoroughly inspect the appliance for signs of damage or deterioration especially the flue system and the electrical apparatus.
- Check and adjust if necessary all burner pressure settings (see 7.3).
- Check and adjust if necessary the system design pressure (see 5.10).
- Carry out an analysis of the flue gases (see 7.4), and visually check the condition of the entire flue assembly.
- Compare the results with the appliance design specification. Any deterioration in performance must be identified and rectified without delay.
- Check that the main heat exchanger are clean and free from any debris or obstruction.
- Check and clean if necessary the condense trap to ensure correct operation.

The flame side of the burner is made of state-of-the-art material. Being fragile:

- be particularly careful when handling, mounting or dismantling the burner and adjacent components (e.g. electrodes, insulation panelling etc.)
- avoid direct contact with any cleaning appliance (e.g. brushes, aspirators, blowers, etc.).

This component does not need any maintenance, please do not remove it from its housing, save where the O-ring may have to be replaced.

The manufacturer declines all responsibility in cases of damages due to failing to observe the above.

#### 6.3 REPLACEMENT OF COMPONENTS

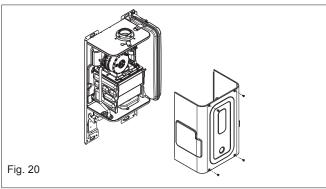

Although it is anticipated that this appliance will give years of reliable, trouble free service, the life span of components will be determined by factors such as operating conditions and usage. Should the appliance develop a fault, the fault finding section will assist in determining which component is malfunctioning.

#### 6.4 COMPONENT REMOVAL PROCEDURE

To remove a component, access to the interior of the appliance is essential. Isolate the appliance from the electrical supply and remove the fuse. And when necessary, close all service valves on the appliance, remove the appliance casing as described in section 4.7.1 and drain the water content from the appliance via the drain valve. Ensure some water absorbent cloths are available to catch any residual water that may drip from the appliance or removed component. Undertake a complete commissioning check as detailed in section 5, after replacing any component. ALWAYS TEST FOR GAS TIGHTNESS IF ANY GAS CARRYING COMPONENTS HAVE BEEN REMOVED OR DISTURBED.

#### 6.4.1 AIR BOX FRONT COVER REMOVAL (fig. 20)

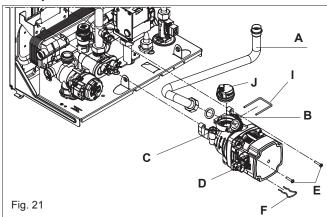

Locate the 4 screws and remove air box front cover.

#### 6.5 PUMP ASSEMBLY (fig. 21)

Carry out component removal procedure as described in 6.4. Disconnect and remove the pump outlet pipe (A) from the pump assembly/combustion chamber connection.

Remove the expansion pipe locking pin (B) from the top of the pump assembly and withdraw the flexible pipe. Locate and remove the pressure gauge securing pin (C) and disconnect the pressure gauge from the pump assembly. Disconnect the electrical wiring from the pump's electrical connection point (D). Locate and remove the 2 securing screws (E) at the rear of the pump assembly. Remove locking pin (F) from pump base and lift pump assembly clear of the hydraulic manifold. The pump assembly can now be removed from the appliance. Replace carefully in the reverse order.

#### 6.6 SAFETY VALVE (fig. 22)

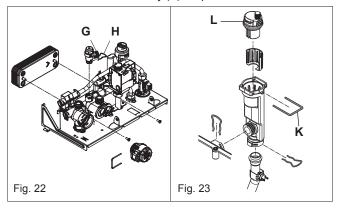

Carry out component removal procedure as described in 6.4. Disconnect the outlet pipe (G) from the safety valve, remove safety valve locking pin (H) from the hydraulic manifold. Replace in the reverse order.

### 6.7 LOWER AUTOMATIC AIR RELEASE VALVE (fig. 21)

Carry out component removal procedure as described in 6.4. Remove the expansion pipe locking pin (B) from the pump assembly and remove the expansion pipe. Locate and remove the AAV locking pin (I) from the pump assembly and remove the AAV assembly (J). Replace in the reverse order.

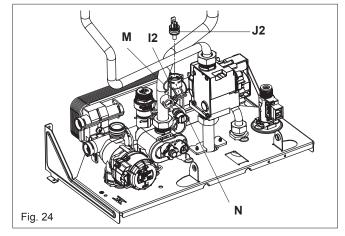

#### 6.7.1 TOP AUTOMATIC AIR RELEASE VALVE (fig. 23)

Carry out component removal procedure as described in 6.4. Remove the AAV locking pin (**K**) from the deaerator assembly and remove the AAV assembly (**L**). Replace in the reverse order.

#### 6.8 WATER PRESSURE SWITCH (fig. 24)

Carry out component removal procedure as described in 6.4. Locate and remove the locking pin ( $\mathbf{M}$ ) from the water pressure switch ( $\mathbf{N}$ ). Remove the wiring. Carefully withdraw the switch. Replace in the reverse order.

#### 6.9 FLOW THERMISTOR (fig. 4 - pos. 17)

Carry out component removal procedure as described in 6.4. Unclip and remove the air chamber front cover. Unclip the flow thermistor from the flow outlet pipe. Disconnect thermistor electrical plug. Replace in the reverse order.

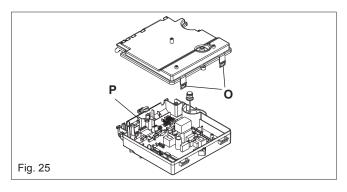

#### 6.10 RETURN THERMISTOR (fig. 4 - pos. 21)

Carry out component removal procedure as described in 6.4. Unclip and remove the air chamber front cover. Unclip the return thermistor from the return inlet pipe. Disconnect thermistor electrical plug. Replace in the reverse order.

#### 6.11 PRINTED CIRCUIT BOARD (fig. 25)

Carry out component removal procedure as described in 6.4. Pull the control fascia forward and lower it. Push the clips (**O**) which secure the PCB cover, remove cover, after carefully taking note of all wiring connections and jumper tag configuration. Unhook and remove connection block (**P**). Disconnect all wiring from the PCB, locate and remove the PCB securing screws, remove the required PCB. Replace in the reverse order ensuring that the position of the 2 control knobs are correctly aligned with the respective potentiometers on the PCB.

Ensure that the correct jumper tag configuration has been respected. It will be necessary to check the functioning of the PCB is set for the correct boiler type/application.

#### 6.12 GAS VALVE (fig. 26)

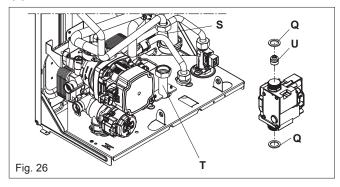

Carry out component removal procedure as described in 6.4. The gas valve must be changed as complete unit. Disconnect the electrical plug and leads from the gas valve, slacken and unscrew gas valve inlet and outlet connections. **Please note**, the sealing washers (**Q**) must be discarded and replaced with new sealing washers. Disconnect the compensation pipe (**R**). Unscrew gas pipe connections (**S-T**), the gas valve can now be removed. Replace in the reverse order. Check and adjust burner pressure settings.

### WARNING, A GAS TIGHTNESS CHECK MUST BE CARRIED OUT.

#### 6.12.1 INJECTOR (fig. 26)

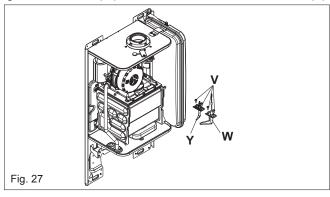

Carry out component removal procedure as described in 6.4. Unscrew and remove gas pipe connections (**S-T**). Locate and remove the injector (**U**) inside the valve. Replace in the reverse order. Check and adjust burner pressure settings.

### WARNING, A GAS TIGHTNESS CHECK MUST BE CARRIED OUT.

#### 6.13 ELECTRODES (fig. 27)

Carry out component removal procedure as described in 6.4. Remove the air chamber front cover. Disconnect the electrode leads and ancillary wiring from their respective connectors. Remove the retaining screws (**V**) for electrode. Remove the spark ignition electrode (**W**). Remove the flame sensor electrod (**Y**).

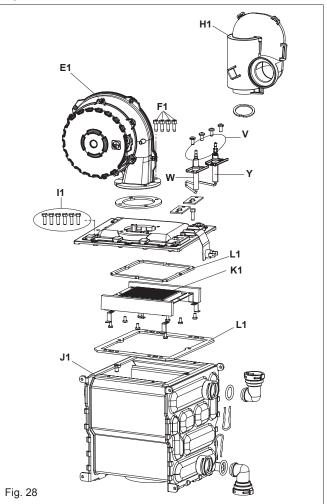

#### 6.14 FLUE FAN & MIXER (fig. 28-29)

Carry out component removal procedure as described in 6.4. Remove the air chamber front cover. Locate and remove the gas pipe locking pin (A1) and swing/rotate the gas pipe away from the fan assembly (B1), (if necessary unscrew the gas pipe from the gas valve G1). Locate and slacken the silencer (H1). Locate and remove the sense electrode. To remove the fan (E1), disconnect the electrical connections attached to the fan, locate and remove the four screws (F1). Gently ease the fan from its location. Replace in the reverse order.

Ensure all seals are in good condition, taking care to ensure they are replaced correctly.

#### 6.15 BURNER (fig. 28-29)

Carry out component removal procedure as described in 6.4. Remove the air chamber front cover. Locate and remove the gas pipe locking pin (A1) and swing/rotate the gas pipe away from the fan assembly (B1), (if necessary unscrew the gas pipe from the gas valve G1). Locate and slacken the silencer (H1), disconnect the electrical connections attached to the fan. Disconnect the electrode leads and ancillary wiring from their respective connectors. Locate and remove the screws (I1) which secure the burner assembly in position to the heat exchanger (J1). Gently ease the fan assembly out of its location. Once the assembly has been removed, the burner (K1) can be withdrawn from the heat engine. Ensure the seals (L1) is in good condition, taking care to ensure it is replaced correctly. Replace in the reverse order.

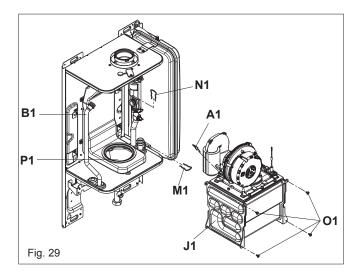

#### 6.16 MAIN HEAT EXCHANGER (fig. 29)

Carry out component removal procedure as described in 6.4. Remove the air chamber front cover. Locate and remove the gas pipe locking pin (A1) and swing/rotate the gas pipe away from the fan assembly (B1), (if necessary unscrew the gas pipe from the gas valve). Disconnect the electrical connections attached to the fan. Disconnect the electrode leads and ancillary wiring from their respective connectors.

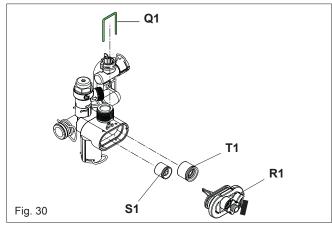

Disconnect the flow locking pin (M1), return locking pin (N1) on the heat exchanger. Locate and remove the 4-screws that secure the heat exchanger to the combustion chamber (O1). Move the heat exchanger and disconnect it from the flue collector (P1). The heat exchanger can now be lifted up and withdrawn from the appliance.

Replace in the reverse order. Ensure all seals are in good condition, taking care to ensure they are replaced correctly.

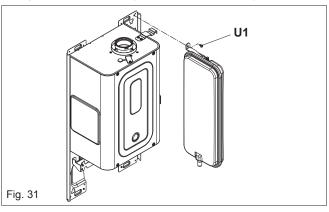

#### 6.17 AUTOMATIC BY-PASS & DHW NON-RETURN VALVE (fig. 30)

Carry out component removal procedure as described in 6.4. Remove the locking pin (Q1) that secures the cover (R1) to the hydraulic manifold. Using a hooked piece of wire, carefully withdraw the by-pass cartridge (S1) and/or DHW non-return cartridge (T1). Ensure all seals are in good condition, taking care to ensure they are replaced correctly. Replace in the reverse order ensuring the cartridge is facing the correct way.

#### 6.18 EXPANSION VESSEL REMOVAL (fig. 31)

Carry out component removal procedure as described in 6.4. Disconnect the expansion vessel from the flexible expansion pipe. Disconnect the flexible expansion pipe from the vessel. Unscrew the nut that secures the vessel to the lower frame. Locate and remove the screw (**U1**) that secure the vessel to the top. The expansion vessel can now be removed. Replace in the reverse order. Ensure all seals are in good condition, taking care to ensure they are replaced correctly.

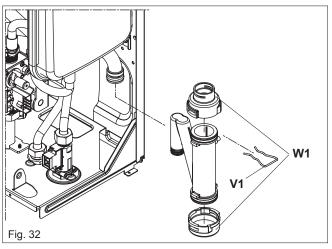

#### 6.19 CONDENSE TRAP REMOVAL (fig. 32)

Carry out component removal procedure as described in 6.4. Disconnect the the locking pin (V1) that secures the trap to the air condense pipe. Disconnect the lower rubber condense pipe from the condense trap. Carefully remove the condense trap. For cleaning unlock the upper and lower closing plug (W1). Replace in the reverse order.

#### NOTE

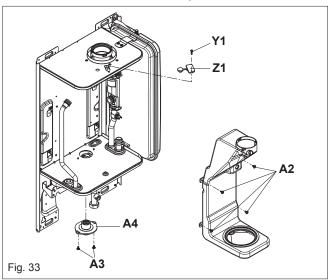

It is essential that the syphon is primed with clean water after it has been removed for cleaning or before the appliance is commissioned. To prime the syphon, fill it to approximately 3/4 full before refitting it as detailed.

Warning: After maintenance work, fill the siphon, following the instructions of § 5.3.

#### 6.20 FLUE COLLECTOR REMOVAL (fig. 33)

Carry out component removal procedure as described in 6.4. Remove the air chamber front cover. Remove the heat exchanger as per 6.16. Locate and remove the screw (Y1) that secures the flue gas analysis test point cover (Z1). Disconnect the flues thermistor wiring connections. Locate and remove the 4 screws (A2). Locate and remove the 2 screws (A3). Gently ease the condensate collector (A4) out off its location. Gently ease the flue collector out off its location. Replace in the reverse order.

#### 6.20.1 DHW FLOW RESTRICTOR (fig. 34)

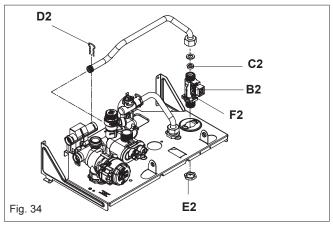

Carry out the component removal procedure as described in 6.4

Disconnect the cold water inlet pipe at the DHW flow switch (B2). Using a small screwdriver, gently ease the flow restrictor (C2) from its seating. Replace in the reverse order. Ensure all seals are in good condition, taking care to ensure they are replaced correctly.

#### 6.20.2 DHW FLOW SWITCH (fig. 34)

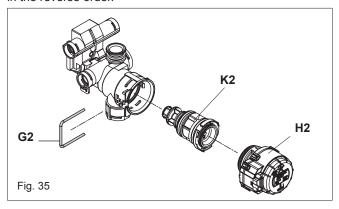

Carry out component removal procedure as described in 6.4. Remove the locking pin (**D2**). Disconnect and remove the cold water inlet pipe from the DHW flow switch & DHW heat exchanger. Disconnect the wiring to the DHW flow switch. Slacken and unscrew the inlet connection. Unscrew the nut (**E2**). Lift the DHW flow switch housing from its seating. If necessary remove the locking pin (**F2**) from the DHW flow switch, taking care not to lose the float contained within the housing.

Replace in the reverse order ensuring that the housing is firmly inserted onto its seating. Ensure all seals are in good condition, taking care to ensure they are replaced correctly.

#### 6.20.3 VALVE ACTUATOR (fig. 35)

Carry out component removal procedure as described in 6.4. Disconnect the electrical plug from the actuator (**H2**). Replace in the reverse order.

#### 6.20.4 DHW THERMISTOR (fig. 24)

Carry out component removal procedure as described in 6.4. Locate and remove the thermistor locking pin (**I2**). Gently ease the thermistor assembly (**J2**) from the hydraulic manifold. Replace in the reverse order.

#### 6.20.5 DIVERTOR VALVE ASSEMBLY (fig. 35)

Carry out component removal procedure as described in 6.4. Remove the valve actuator as described in 6.20.3. Locate and remove the locking pin (G2) that secures the valve housing cover to the hydraulic manifold. Gently prise the valve assembly from the manifold (K2). Replace in the reverse order ensuring that the seating assembly is inserted properly. Ensure all seals are in good condition, taking care to ensure they are replaced correctly.

#### **SECTION 7 - CHECKS, ADJUSTMENTS AND FAULT FINDING**

#### 7.1 CHECKING APPLIANCE OPERATION

When carrying out any repairs or servicing to the appliance, the relevant commissioning procedure must be undertaken to ensure the continued safe operation of the appliance. Particular attention should be made to ensure gas tightness, water tightness and the electrical integrity of the appliance.

### 7.2 APPLIANCE MODES OF OPERATION NOTE

There must be sufficient system water pressure (min. 0.5 bar) to ensure the water pressure switch is activated. If there is insufficient system pressure the pump and fan will be prevented from operating and the low-pressure fault code will be indicated.

**7.2.1 SELECTOR SWITCH IN THE OFF/RESET POSITION** When the selector switch is in the OFF/RESET position, the following functions are active.

#### **Active functions:**

- · frost-protection system
- · pump & actuator anti-block.

#### 7.2.2 ON-BOARD FUNCTIONS

- CO FUNCTION: the CO function when activated, will allow the appliance to run at CH maximum, DHW maximum or minimum output whilst a combustion analysis check or a mechanical gas valve calibration is being carried out. Whilst the CO function is active, all other functions are disabled (minimum power operating period, anti-cycle, set-point, etc). Once enabled, the CO function will remain active for a 15-minute period, or until the function is manually deactivated
- FROST-PROTECTION: this function is only active when there are no requests for heating or DHW. If the temperature drops below 5°C, the boiler will operate on minimum power until the temperature of the thermistors reaches 35°C for CH and 55°C for DHW. Thereafter the pump & fan will over-run for 30-seconds.
- ANTI-CYCLE FUNCTION: the anti-cycle function ensures the burner remains switched off for at least 3-minutes after the set-point hysterisis (set-point + 5-deg) for CH heat request.
- PUMP ANTI-BLOCK FUNCTION: when there has been no heating or HW request for 24-hours, the anti-block cycle is activated. The pump will be activated for a period of 30-seconds.
- ACTUATORANTI-BLOCK FUNCTION: when there has been no heating or HW request for 24-hours, the anti-block cycle is activated. The divertor valve actuator will motor briefly to the heating position, and then back to the DHW position. The pump will run briefly.
- SARA function: the SARA function permits the boiler (when the set-point is within the SARA range) to automatically adjust (raise) the heating flow outlet temperature should the room thermostat contacts remain closed for more that 20-minutes.
- DHW PRE-HEAT FUNCTION: when the DHW pre-heat function is enabled, the appliance will light periodically to maintain the temperature of the DHW heat exchanger. When the DHW thermistor and the primary thermistor fall below 35 °C and 55 °C respectively, the boiler will fire on minimum +25% power until the primary thermistor exceeds 55 °C. Thereafter the pump will over-run for a period of 30-seconds.

#### 7.2.3 HEATING MODE

With the selector switch in the heating & hot water position and any additional controls (time clock, programmer, room thermostat, etc.) calling for heat, the appliance will operate in the heating mode. The pump and fan will be activated via the flow temperature sensor. When the fan is sensed to be operating correctly (tacho signal), the ignition sequence commences. Ignition is sensed by the electronic circuit to ensure flame stability at the burner. Once successful ignition has been achieved, the electronic circuitry increases the gas rate to 75% for a period of 15 minutes. The speed of the fan and therefore the output of the boiler is determined by the temperature of the water sensed by the flow temperature sensor, consequently a high temperature at the flow sensor results in a lower fan speed. As the water temperature increases, the temperature sensors - located on the flow pipe of the boiler – reduce the fan speed via the electronic circuitry. Depending on the load, either the water temperature will continue to rise until the set point is achieved or the water temperature will fall whereby fan speed will increase relative to the output required. When the boiler has reached the set point (+ hysterisis), the burner will switch off. The built-in anti-cycle device prevents the burner from re-lighting for approximately 3-minutes. When the temperature of the flow sensor falls below the set point (- hysterisis), the burner will re-light.

#### **NOTE**

If the spark/sensing electrode does not sense ignition the appliance will re-attempt ignition a further 4-times then go to lockout. When the set-point has been reached (the position of the heating temperature selector) as measured at the primary thermistor, the appliance will begin the modulation phase whereby the fan and gas valve will continuously modulate to maintain the set-point. If the temperature continues to rise and exceeds the set-point by 5°C (hysterisis), the burner will shut down. A new ignition sequence will be enabled when the 3- minute anti-cycle has been performed and the temperature at the primary thermistor has dropped 5°C (hysterisis) below the set-point.

#### 7.2.4 DHW MODE

With the selector switch in either the hot water only or heating & hot water position, the appliance will operate in the hot water mode whenever a DHW outlet is opened. A flow rate exceeding 2-litres per minute will activate the DHW flow switch whereupon the pump and fan will be activated via the flow temperature sensor. When the fan is sensed to be operating correctly (tacho signal), the ignition sequence commences. Ignition is sensed by the electronic circuitry to ensure flame stability at the burner. Once successful ignition has been achieved, the electronic circuit allows the gas rate to achieve the modulation value.

#### NOTE

When the request for heating and/or hot water has been satisfied, the appliance pump and fan may continue to circulate to dissipate any residual heat within the appliance.

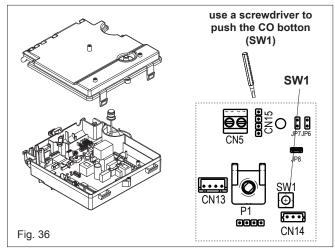

#### **ATTENTION**

Gas type and appliance output **must be set** according to the specific appliance specification. Vokèra accepts no responsibility if the gas type is not correctly adjusted according to the respective appliance specification as detailed on the appliance data badge.

### 7.3 CHECKING THE CO<sub>2</sub> AND ADJUSTING THE GAS VALVE

THE GAS VALVE MUST BE SET-UP OR ADJUSTED WITH THE AID OF A PROPERLY CALIBRATED FLUE GAS ANALYSER.

Isolate the appliance from the electrical supply and remove the appliance casing as described in 4.7.1. Restore the electrical supply to the boiler and switch the boiler to the OFF mode. Have access to the printed circuit board, locate and press the CO button (see fig. 36 pos. **SW1**). Press the button the number of times according the function requirement as par 7.3.1. Set the flue gas analyser to read  $CO_2$ , allow the burner to stabilise and insert the probe into the flue analysis test point (Y1-Z1 fig. 33). The appliance will operate in  $CO_2$  mode for approximately 15 minutes.

#### 7.3.1 CO<sub>2</sub> FUNCTION SETTINGS

Locate the CO button (see 7.3)

Select the main selector switch in position  $oldsymbol{\circ}$ 

CO <sub>2</sub> FUNCTIONS	ACTION ON THE BUTTON	LED STATUS
combustion analysis mode	press once = burner running at maximum heating	yellow led blinking
gas valve maximun setting	press twice = burner running at maximum DHW	yellow led blinking + red led fixed
gas valve minimum setting	press three time = burner running at minimum	yellow led blinking + green led fixed

#### **NOTE**

- 1 Any additional pressing of CO button after the third time the burner switched between maximum DHW and minimum.
- 2 To restart the CO function it is necessary to pass throught the position with the main selector switch. If the CO<sub>2</sub> values do not correspond to the values in the technical data table, make further adjustments.

#### 7.3.2 GAS VALVE MAXIMUM SETTING

Set the CO<sub>2</sub> button at maximum (see 7.3.1), once the maximum is obtained check that it corresponds with the appropriate CO<sub>2</sub> value (Maximum) for the respective appliance (see 2.11). If the CO<sub>2</sub> reading is correct, proceed to gas valve minimum setting (7.3.3).

However, if the CO<sub>2</sub> reading is incorrect, the maximum gas pressure must be adjusted as follows:

using a 2.5mm Allen key, very slowly turn the maximum adjustment screw (see fig. 37) – clockwise to decrease, counter clockwise to increase – until the correct value is displayed on the CO<sub>2</sub> analyser (allow time for the analyser to stabilise).

#### 7.3.3 GAS VALVE MINIMUM SETTING

Set the  $CO_2$  button at minimum (see 7.3.1), once the minimum is obtained check that it corresponds with the appropriate  $CO_2$  value (Minimum) for the respective appliance (see 2.11). If the  $CO_2$  reading is correct, proceed to completion (7.3.4).

However, if the CO<sub>2</sub> reading is incorrect, the minimum gas pressure must be adjusted as follows:

- locate the minimum adjustment screw (fig. 37), using a suitable screwdriver remove the protection plug
- using a 4mm Allen key, very slowly turn the minimum adjustment screw (see fig. 37) clockwise to increase, counter clockwise to decrease until the correct value is displayed on the CO<sub>2</sub> analyser (allow time for the analyser to stabilise).

#### 7.3.4 COMPLETION

On completion of the combustion analysis check and/or any gas valve adjustment, refit the printed circuit board cover (fig.

36) and move the mode selector throught **O** position. Remove the test probe from the test point and refit the sealing screw/s and/or cap.

#### IMPORTANT

A GAS TIGHTNESS CHECK MUST BE CARRIED OUT IF ANY GAS CARRYING COMPONENTS HAVE BEEN REMOVED, REPLACED OR DISTURBED.

#### 7.4 COMBUSTION ANALYSIS TEST

A combustion analysis check can easily be carried out on the appliance via the test points located on the top of the appliance (see 7.3).

- Operate the boiler in combustion analysis mode (see 7.3.1)
- Insert the flue gas analyser probe into the flue gas test point (see fig. 33) and compare the values with those shown in section 2 (Nat. Gas) or section 9 (LPG). If different adjust the gas valve according to 7.3.1, 7.3.2, & 7.3.3.

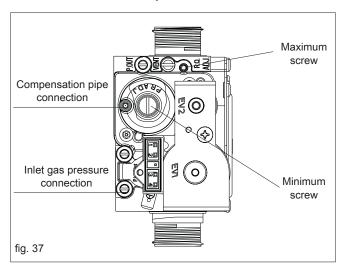

The appliance will operate in CO<sub>2</sub> mode for approximately 15minutes.

**Note**: If a measured CO/CO<sub>2</sub> ratio of 0.004/1 or less AND a CO reading of less than 350ppm cannot be achieved, please contact Vokera technical for advice.

**Note:** When checking the air inlet test point, insert the probe no more than 25mm into the test point.

#### 7.5 CHECKING THE EXPANSION VESSEL

Carry out the component removal procedure as described in 6.4. You must ensure that the boiler is completely drained of water. Using a suitable pressure gauge, remove dust cap on expansion vessel and check the charge pressure. The correct charge pressure should be 1.0 bar  $\pm$  0.1 bar. If the charge pressure is less, use a suitable pump to increase the charge.

#### NOTE

You must ensure the drain valve is in the open position whilst re-charging takes place. Replace the dust cap and carry out the relevant commissioning procedure (section 5).

#### 7.6 EXTERNAL FAULTS

Before carrying out any faultfinding or component replacement, ensure the fault is not attributable to any aspect of the installation.

#### 7.6.1 INSTALLATION FAULTS

Symptom	Possible cause
No ignition	Check wiring/check electrical supply
No hot water	Check pipe-work
No heating	Check external controls

Fault	Possible cause	
Red led fixed	Check gas supply, check flue	
	system, check polarity	

#### 7.7 ELECTRICAL CHECKS

Any electrical checks must be carried out by a suitably qualified person.

#### 7.7.1 EARTH CONTINUITY TEST

Isolate the appliance from the electrical supply, and using a suitable multi-meter carry out a resistance test. Connect test leads between an appliance earth point and the earth wire of the appliance supply cable. The resistance should be less than 1 OHM. If the resistance is greater than 1 OHM check all earth wires and connectors for continuity and integrity.

#### 7.7.2 SHORT CIRCUIT CHECK

Isolate the appliance from the electrical supply, and using a suitable multi-meter, carry out a short circuit test between the Live & Neutral connections at the appliance terminal strip. Repeat above test on the Live & Earth connections at the appliance terminal strip.

#### NOTE

Should it be found that the fuse has failed but no fault is indicated, a detailed continuity check will be required to trace the fault. A visual inspection of components may also assist in locating the fault.

#### 7.7.3 POLARITY CHECK

With the appliance connected to the electrical supply and using a suitable multimeter, carry out the following voltage tests:

- connect test leads between the Live & Neutral connections at the appliance terminal strip. The meter should read approximately 230V ac. If so proceed to next stage. If not, see 7.7.4.
- connect test leads between the Live & Earth connections at the appliance terminal strip. The meter should read approximately 230V ac. If so proceed to next stage. If not, see 7.7.4.
- connect test leads between the Neutral & Earth connections at the appliance terminal strip. The meter should read approximately 0 15Vac. If so polarity is correct. If not, see 7.7.4.

#### 7.7.4 REVERSED POLARITY OR SUPPLY FAULT

Repeat the above tests at the appliance isolator, if testing reveals correct polarity and/or supply at the isolator, re-check wiring and connections between the isolator and the appliance. If tests on the isolator also reveal reversed polarity or a supply fault, consult the local electricity supplier for advice.

#### 7.7.5 RESISTANCE TO EARTH CHECK

Isolate the appliance from the electrical supply, and using a suitable multi-meter carry out a resistance test. Connect test leads between the Live & Earth connections at the appliance terminal strip. If the meter reads other than infinity there is a fault that must be isolated, carry out a detailed continuity check to identify the location of the fault.

These series of checks must be carried out before attempting any faultfinding procedures on the appliance. On completion of any task that required the disconnection and re-connection of any electrical wiring or component, these checks must be repeated.

#### 7.8 FAULT FINDING

Before attempting any faultfinding, the electrical checks as detailed in 7.7 must be carried out. Isolate the appliance from the electrical supply.

Temporarily disconnect any external controls that are connected to the 2 'room-thermostat' connections (see fig. 39) and insert a temporary link-wire in their place.

#### **NOTE**

Restore the electrical supply and ensure the mode selector switch and the integral time clock are both switched ON for heating. The boiler should now function as described in section 7. Should the boiler fail to respond, the internal fuses and connectors should be checked to ensure integrity and continuity.

### 7.9 COMPONENT VALUES & CHARACTERISTICS

COMPONENT	VALUE
Fan	230Vac
Pump	230Vac
Valve actuator	230Vac
Ignition transformer	230Vac
Gas valve	230Vac
Room thermostat connection	24Vdc
NTC thermistor (dry contact)	10Kohm
NTC thermistor (wet contact)	10Kohm
FUNCTION	VALUE
Standard Heating temperature range	
(min – max °C)	40 - 80
DHW temperature range (min – max °C)	37 - 60
75% maximum CH time	15 min
Heating OFF hysterisis (°C)	SP + 5
Heating ON hysterisis (°C)	SP - 5
DHW OFF hysterisis (°C)	SP + 5
DHW ON hysterisis (°C)	SP + 4
Anti-cycle delay	3-min
Pump over-run	30-sec
Low output (min. output + %)	Min+25
CO function max temp. (°C)	90
CO re-light temp. (°C)	78
CO function time	15-min
Flow NTC max temp. (°C)	90
High limit thermostat (°C)	105
Flue NTC max temp. (°C)	125
Maximum differential (°C)	35
IGNITION CONTROL	VALUE
Ignition attempts before L/O (lockout)	5
Re-ignition attempts after loss of flame signal	5

#### **APPLIANCE STATUS LED AND FAULT CODES**

When the boiler detects a temporary fault condition, the appropriate led indication is shown. If/when the fault is final, the pump will perform a 60-second post circulation and the red LED will be illuminated. See table on pag. 4.

#### **SECTION 8 - WIRING DIAGRAMS**

#### 8.1 EXTERNAL WIRING

The appliance comes supplied with an integral time clock to allow operation of the boiler via the mode selector switch. If external controls are to be added to the system, they must be connected to the appliance as shown in the following diagrams. For advice on controls that are not featured in this book, please contact Vokèra technical on 0844 391 0999.

#### 8.1.1 EXTERNAL WIRING LIMITATIONS

Low voltage and High voltage cables must be run separately. Any external wiring must remain within the limits as detailed: room thermostat = 30-metres.

#### 8.2 TYPICAL CONTROL APPLICATIONS

The appliance can be used with the following 'voltage-free' controls:

- external single-channel time clock
- · programmable room thermostat
- · room thermostat.

#### 8.3 BeSMART CONTROLS

The appliance can also be used with the Vokèra BeSMART range of smart controls.

#### 8.4 WEATHER COMPENSATION

The appliance can also be used with the Vokèra range of external sensors.

#### 8.5 OTHER DEVICES

Contact the controls manufacturer and/or Vokèra technical department should you require more specific information on the suitability of a particular control.

### 8.6 APPLIANCE INTEGRAL CLOCK & EXTERNAL ROOM THERMOSTAT (Fig. A)

The room thermostat must be connected in-series with the integral time clock (connected to CN5):

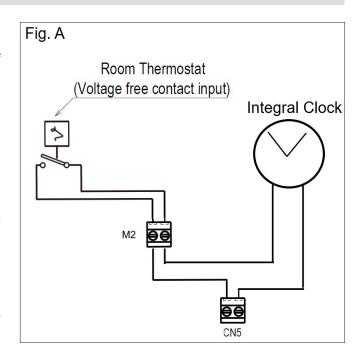

- Locate the room thermostat connections at the cable connected to M2 (fig. 38).
- Remove the link-wire from the room thermostat connections at M2
- Connect the 2 wires from the room thermostat to the room thermostat connections at M2.

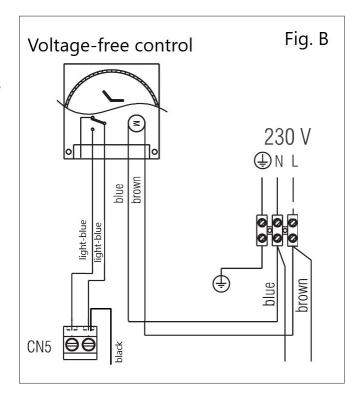

#### 8.7 EXTERNAL 1-CH TIME CLOCK (Fig. B)

- Remove the 2 light-blue wires and the single Black wire from CN5, taping them up and making safe.
- Connect the voltage-free wires from the external clock to the connections at CN5.
- Any external room thermostat must be wired in-series with the external time clock connected at CN5.
- Ensure all external controls connected to CN5 are voltagefree.

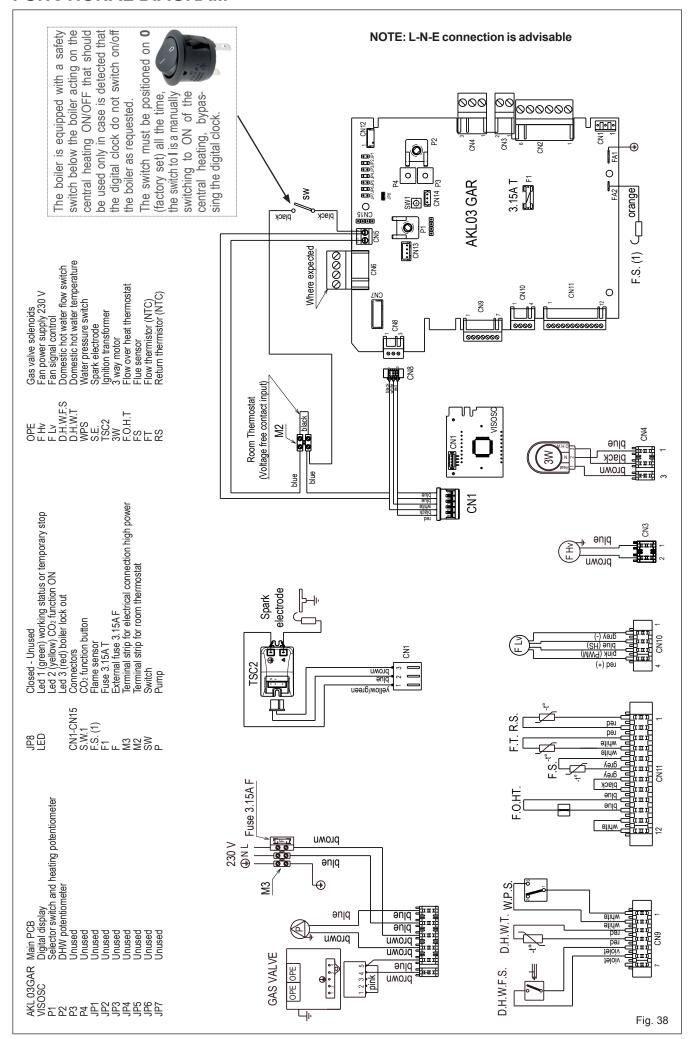

### 8.8 PROGRAMMABLE ROOM THERMOSTAT (Fig. B)

- Remove the 2 light-blue wires and the single Black wire from CN5, taping them up and making safe.
- Connect the voltage-free wires from the external programmable room thermostat to the connections at CN5.
- Ensure all external controls connected to CN5 are voltagefree

#### **FUNCTIONAL DIAGRAM**

BS 6798		INSTALLATION OF BOILERS OF RATED NOT EXCEEDING 60kW

#### 9.2 TECHNICAL DATA

	Easi-Heat Plus 25 Ci	Easi-Heat Plus 29 Ci	Easi-Heat Plus 32 Ci
Inlet pressure	37.0 mbar	37.0 mbar	37.0 mbar
Heating maximum gas rate (kg/hr)	1.55	1.94	1.94
DHW maximum gas rate (kg/hr)	1.94	2.25	2.45
Minimum gas rate (kg/hr)	0.39	0.47	0.47
Injector size	3.8 mm	3.9 mm	3.9 mm
Silencer flange	27 mm	29 mm	29 mm
CO2 @ maximum output (%)	10.5	10.5	10.5
CO2 @ minimum output (%)	10.5	10.5	10.5
CO @ maximum output (ppm)	190	250	250
CO @ minimum output (ppm)	20	25	25
Slow ignition fan speed (rpm)	4.000	4.000	4.000
CH maximum number of fan rotation (rpm)	4.900	5.200	5.200
DHW maximum number of fan rotation (rpm)	6.100	6.000	6.700
Mimum number of fan rotation (rpm)	1.400	1.400	1.400

#### 9.3 CONVERTING THE APPLIANCE GAS TYPE

To convert the appliance to another gas type it is necessary to change the injector and adjust the gas valve  $(CO_2)$ .

- To change the injector see 6.12.1.
- To replace the flange on the silencer (only Easi-Heat Plus Ci 29 and 32) see 6.15.
- To adjust CO<sub>2</sub> values see 9.6.

#### 9.4 GAS SUPPLY

The gas supply must be connected to the appliance by a competent LPG installer and must be of sufficient size to supply the appliance at its maximum output. An existing supply must be checked to ensure that it is of adequate size to deal with the maximum rated input of this and any other appliances that it serves.

#### 9.5 GAS SUPPLY INSTALLATION

The entire installation including the meter must be purged and checked for gas tightness.

### 9.6 CHECKING THE CO2 AND ADJUSTING THE

### THE GAS VALVE MUST BE SET-UP OR ADJUSTED WITH THE AID OF A PROPERLY CALIBRATED FLUE GAS ANALYSER

Isolate the appliance from the electrical supply and remove the appliance casing as described in 4.7.1. Restore the electrical supply to the boiler and switch the boiler to the OFF mode. Have access to the printed circuit board, locate and press the CO button (see fig. 36 pos. **SW1**). Press the button the number of times according the function requirement as par 7.3.1. Set the flue gas analyser to read CO<sub>2</sub>, allow the burner to stabilise and insert the probe into the flue analysis test point (Y1-Z1 fig. 33). The appliance will operate in CO<sub>2</sub> mode for approximately 15 minutes.

#### 9.6.1 CO<sub>2</sub> FUNCTION SETTINGS

Locate the CO button (see 7.3).

Select the main selector switch in position **O**.

#### 9.6.2 GAS VALVE MAXIMUM SETTING

Set the CO button at maximum (see 9.6.1), once the maximum is obtained check that it corresponds with the appropriate CO<sub>2</sub> value (Maximum) for the respective appliance. If the CO<sub>2</sub> reading is correct, proceed to gas valve minimum setting (9.6.2). However, if the CO<sub>2</sub> reading is incorrect, the maximum gas pressure must be adjusted as follows:

using a 2.5mm Allen key, very slowly turn the maximum adjustment screw (see fig. 37) – clockwise to decrease, counter clockwise to increase – until the correct value is displayed on the CO<sub>2</sub> analyser (allow time for the analyser to stabilise).

#### 9.6.3 GAS VALVE MINIMUM SETTING

Set the CO button at minimum (see 9.6.1), once the minimum is obtained check that it corresponds with the appropriate CO<sub>2</sub> value (Minimum) for the respective appliance. If the CO<sub>2</sub> reading is correct, proceed to completion (9.6.4).

However, if the CO<sub>2</sub> reading is incorrect, the minimum gas pressure must be adjusted as follows:

- locate the minimum adjustment screw (fig. 37), using a suitable screwdriver remove the protection plug
- using a 4mm Allen key, very slowly turn the minimum adjustment screw (see fig. 37) clockwise to increase, counter clockwise to decrease until the correct value is displayed on the CO<sub>2</sub> analyser (allow time for the analyser to stabilise).

#### 9.6.4 COMPLETION

On completion of the combustion analysis check and/or any gas valve adjustment, refit the printed circuit board cover (fig. 36) and move the mode selector to the position. Remove the test probe from the test point and refit the sealing screw/s and/or cap.

#### **IMPORTANT**

A GAS TIGHTNESS CHECK MUST BE CARRIED OUT IF ANY GAS CARRYING COMPONENTS HAVE BEEN REMOVED, REPLACED OR DISTURBED.

#### **ATTENTION**

Gas type and appliance output **must be set** according to the specific appliance specification. Vokèra accepts no responsibility if the gas type is not correctly adjusted according to the respective appliance specification as detailed on the appliance data badge.

CO <sub>2</sub> FUNCTIONS	ACTION ON THE BUTTON	LED STATUS
combustion analysis mode	press once = burner running at maximum heating	yellow led blinking
gas valve maximun setting	press twice = burner running at maximum DHW	yellow led blinking + red led fixed
gas valve minimum setting	press three time = burner running at minimum	yellow led blinking + green led fixed

#### **NOTE**

- 1 Any additional pressing of CO button after the third time the burner switched between maximum DHW and minimum.
- 2 To restart the CO₂ function it is necessary to pass throught the **(** position with the main selector switch.

#### COMMISSIONING: CO AND COMBUSTION RATIO CHECK

#### BEFORE CO AND COMBUSTION RATIO CHECK

The installation instructions should have been followed, gas type verified and gas supply pressure/rate checked as required prior to commissioning.

As part of the installation process, **ESPECIALLY WHERE A FLUE HAS BEEN FITTED BY PERSONS OTHER THAN THE BOILER INSTALLER**, visually check the integrity of the whole flue system to confirm that all components are correctly assembled, fixed and supported. Check that the maximum flue lengths have not been exceeded and all guidance has been followed (e.g. Technical Bulletin 008).

The flue gas analyser should be of the correct type, as specified by BS 7967.

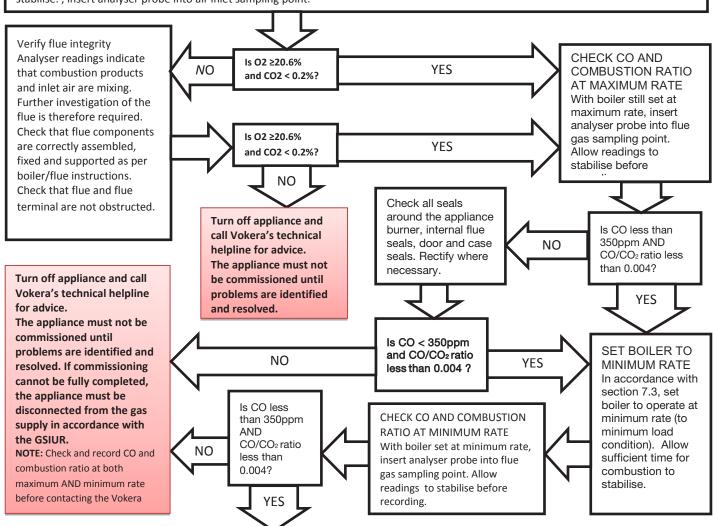

Before use, the flue gas analyser should have been maintained and calibrated as specified by the manufacturer. The installer must have the relevant competence for use of the analyser. Check and zero the analyser **IN FRESH AIR**, as per analyser manufacturer's instructions.

#### **NOTE**

The air/gas ratio valve is factory-set and must not be adjusted during commissioning unless this action is recommended, following contact with the Vokera technical help line. If any such adjustment is recommended and further checking of the boiler is required, the engineer must be competent to carry out this work and to use the flue gas analyser accordingly. If the boiler requires conversion to operate with a different gas family (e.g., conversion from natural gas to LPG) separate guidance will be provided by the Vokera technical help line and must be followed.

#### SET BOILER TO MAXIMUM RATE

In accordance with, section 7.3, set boiler to operate at maximum rate (full load condition). Allow sufficient time for combustion to stabilise., insert analyser probe into air inlet sampling point.

### Boiler is operating satisfactorily No further actions required.

Ensure test points are capped, boiler case is correctly replaced and all other commissioning procedures are completed. Complete Benchmark Checklist, recording CO and combustion ratio readings as required.

# **Benchmark Commissioning and Servicing Section**

It is a requirement that the boiler is installed and commissioned to the manufacturers instructions and the data fields on the commissioning checklist completed in full.

To instigate the boiler guarantee the boiler needs to be registered with the manufacturer within one month of the installation.

To maintain the boiler guarantee it is essential that the boiler is serviced annually by a Gas Safe registered engineer who has been trained on the boiler installed. The service details should be recorded on the Benchmark Service Interval Record and left with the householder.

#### GAS BOILER SYSTEM COMMISSIONING CHECKLIST

This Commissioning Checklist is to be completed in full by the competent person who commissioned the boiler as a means of demonstrating compliance with the appropriate Building Regulations and then handed to the customer to keep for future reference.

Failure to install and commission according to the manufacturer's instructions and complete this Benchmark Commissioning Checklist will invalidate the warranty. This does not affect the customer's statutory rights.

#### **SERVICE RECORD**

It is recommended that your heating system is serviced regularly and that the appropriate Service Interval Record is completed.

#### Service Provider

Before completing the appropriate Service Record below, please ensure you have carried out the service as described in the manufacturer's instructions. Always use the manufacturer's specified spare part when replacing controls.

#### **Vokèra Warranty Terms and Conditions**

Vokèra Ltd offer customers the comfort of a parts and labour warranty repair service subject to the following terms and conditions.

Vokèra Ltd only obligation under the guarantee shall be to repair or replace the faulty appliance at Vokèra Ltd discretion. This will be carried out where a fault arises from defects within the appliance, caused by either material or workmanship of the manufacturer.

- 1. The boiler must have been installed and commissioned within 12 months of manufacture by a registered Gas Safe (RGII ROI) installer in accordance with the guidelines in the installation and servicing booklet provided with the boiler.
- 2. This guarantee does not protect malfunction or damage arising from incorrect installation, commissioning or maintenance procedures, as laid out in the installation handbook, inefficient flue system, poor or incorrect electricity, wrong gas supply or pressure, tampering by inexperienced persons and any other cause not directly due to manufacture.
- 3. Vokèra Ltd cannot accept responsibility for any costs arising from repair or maintenance carried out by any third party.
- 4. The "Benchmark" commissioning sheet must be completed by the installer and left with the boiler for reference purpose.
- 5. The warranty will commence from the date of installation. Without proof of purchase ie an invoice or completed "Benchmark" commissioning sheet, the warranty will commence from the date of manufacture as detailed on the appliance data plate.
- 6. To qualify for the full term of warranty, the boiler must be serviced once annually by a Gas Safe Registered Engineer (RGII ROI). Proof of annual service in accordance with the manufacturer's instructions must be provided (e.g. Benchmark Service Record). If this condition is not met the period of warranty will extend to only 12 months from date of installation.

By registering your appliance, you will be helping us provide you with the best after sales service in the unlikely event that your boiler requires attention during the guarantee period.

#### Register online: www.vokera.co.uk (UK) or www.vokera.ie (ROI)

If the boiler suffers a mechanical or an electrical breakdown or you require an annual service, please contact our Customer Care Centre on:

UK: 01274 866100 ROI: 056 7755057

Our normal working hours, excluding Bank holidays are:

8.15am - 5.00pm Monday to Friday 8.00am - 12.00pm Saturday (UK only)

We will arrange for an engineer or appointed agent, to inspect and repair, or where in our sole opinion repair is not economic, arrange to replace the boiler.

#### 7. Health & Safety:

- a. Engineers will only attend to boiler products where it is considered by the engineer that the installation does not pose a risk to health and safety.
- b. A permanently fixed access ladder must service installations in lofts or attics. Adequate lighting and permanently fixed flooring must also be available.
- c. Cupboard installations must provide minimum working clearances as detailed in the installation instructions. Vokèra will not accept responsibility for the removal of cupboards, kitchen units or trims in order to gain access for repairs.

#### 8. Warranty does not apply:

- a. If the boiler is removed from its place of installation without our prior consent.
- b. To any defect, damage or breakdown caused by inadequate servicing of the boiler or by deliberate action, accident, misuse or third party interference including modification or an attempted repair which does not fully comply with industry standards.
- c. To any defect, damage or breakdown caused by the design, installation and maintenance of the central heating system.

- d. To de-scaling or other work required as a result of hard water scale deposits or from damage caused by aggressive water or sludge resulting from corrosion. Indications that such work may be required include a noisy boiler, cold spots on radiators, sludge in pipes and poor circulation of the central heating system.
- e. If the claim/contact procedure set out in section 6 is not adhered to.
- f. To any other costs or expenses caused by or arising as a result of the breakdown of a Vokèra Boiler.
- g. To any costs incurred during delays in fixing reported faults.
- 9. We reserve the right to a charge a callout fee where:
- a. There is no completed "Benchmark" commissioning sheet or equivalent control document present.
- b. There is incomplete or no service record(s) for each and every year the boiler has been installed.
- c. A fault cannot be found.
- d. The breakdown or fault has been caused by an event, which is excluded from the warranty see section 8.
- e. Failure to cancel an agreed appointment prior to our engineers visit.
- f. The boiler is outside the period of warranty or the conditions of the warranty have not been met.
- 10. If we fit replacement parts or replace a boiler it will not extend the period of the warranty. All replaced parts or boilers will become the property of Vokèra Ltd.
- 11. The warranty applies only where a Vokèra boiler has been installed in a domestic dwelling in the United Kingdom, Northern Ireland or Republic of Ireland, to provide heat and/or hot water to the central heating system.
- 12. Vokèra Ltd warranty is offered in addition to the rights provided to a consumer by law. Details of these rights can be obtained from a Trading Standards Authority or a Citizen Advice Bureaux.

#### **Your Personal Details**

Vokèra takes care of your personal details in order to protect your privacy. Below we detail how we use any data you provide us with and how we manage that data to protect it.

Personal data is collected by us confidentially and in accordance with data protection law regulations. Vokèra is registered as a data controller with the Information Commissioner's Office.

Your personal data is only stored if you volunteer to provide it, for example, to request information, submit a service visit, or to register a product for purposes of warranties and surveys etc. Vokèra will only use your personal data to satisfy the request you have made, and will not disclose information to third parties without your prior consent.

Any personal data stored by Vokèra is protected to ensure unauthorised persons cannot access or disclose the data. Vokèra uses security measures to protect the data we collect, in order to prevent manipulation, loss and destruction. No user information provided is stored anywhere on the internet that can be accessed by the public.

Vokèra may like to inform you of products and services that you could be interested in, and request your opinion of our services. Participation is voluntary and you can request not to receive such communications at any time or request your details to be updated by emailing: **marketing@vokera.co.uk**.
